### Product Overview

The **Falcon-X** is a highly integrated, high performance, 10G aggregation and demarcation system, delivering high end Carrier Ethernet services.

This product extensively supports the evolving needs for broadband access services delivery, including high throughput, granular SLA enforcement and monitoring, flexible management capabilities, and a high degree of scalability and flexibility to cater for future requirements and technology trends.

The **Falcon-X** primarily addresses the rapidly-expanding market of mobile backhauling and business access applications.

The **Falcon-X's** unique Hybrid (ASIC-FPGA) HW architecture supports remote Data Plane Upgrades (DPU) to allow modification and addition of packet processing functions that require **full wire speed performance** that cannot be handled by SW.

The **Falcon-X** supports complete precision timing based on Synchronous **Ethernet and 1588-2008** suitable for all modes of mobile backhaul applications.

The **Falcon-X** series are equipped with 12 or 24x dual-rate FE/GE SFP access (UNI) ports, and 2 or 4x 10G SFP+ PowerLink (NNI) ports. The UNI ports operate at full wire speed, resulting in a total processing capacity of 128Gbps (non-blocking).

The **Falcon-X** offers advanced Quality of Service (QoS) features including classification and mapping based on layer 1 through layer 4 attributes, rate limiting per service, and shaping per port, and queue.

All MEF defined services (EPL, EVPL, ELAN, etc) can be configured on the **Falcon-X** series and can also be protected through use of high performance mechanisms, based on G.8031 and G.8032v2, for link, path, and ring resilience.

These features, combined with a highly flexible fault propagation mechanism and unique fast failure detection algorithms yield a comprehensive and sophisticated device that can handle virtually any network topology.

The system implements current OAM standards (802.3ah, 802.1ag, Y.1731) with HW assist as well as proactive measurements and alarming facilities. To complete the OAM toolset, the Falcon-X has a built in packet generator and analyzer to implement RFC2544 for quick service turn-up and verification.

A **unique Micro-Burst-Detection** (MBD) technology for microsecond granular SLA monitoring is incorporated in the system, helping to detect, alert, and report nearly invisible traffic anomalies, which is essential in highly QoS-sensitive applications, such as financial, healthcare, etc.

The **Falcon-X** series is MEF CE2.0 compliant (all service types).

The **Falcon-X** series are packaged in a robust 19"/1RU housing that allow the installation of hot swappable redundant AC and/or DC power supplies.

All the above result in a market leading system.
