proprietary information

This document contains information, which is proprietary to Fibrolan Ltd.

No part of its contents may be used, copied, disclosed or conveyed to a third party in any manner whatsoever without prior written permission from Fibrolan Ltd.

Special Notes

The R Class series includes various Falcon-RX models.

Please refer to the Alphabetical Glossary of terms and definitions for clarification of the terminology found in the User Guide.

The features and characteristics described in this User Guide are common to all R class devices.

For a detailed features vs models cross reference table, please refer to the 'Product Selection Guide' on Fibrolan website.

1 Introduction

1.1 R Class series overview

1.1.1 Falcon-RX

Falcon-RX is a high performance, 5G xHaul Timing Aware O-RAN Switch & PTP Grandmaster. It is a high capacity, low latency transport and high precision synchronization device that enables 5G RAN operation at its optimal throughput, on both telecom and enterprise environments.

The **Falcon-RX** combines the best of breed of the Transport and Timing worlds, in a single powerful package. Both elements are critical for 5G fronthaul deployments, along with support for the latest O-RAN architectures and recommendations.

The **Falcon-RX** is equipped with up to twenty (20) multi-rate 10G SFP+ ports or eight (8) 25G SFP28 ports, based on user configuration. Additionally, one tri-speed Copper management port is included. All ports can operate at full wire speed, with a total forwarding capacity of 200Gbps.

The system offers advanced Quality of Service (QoS) features including classification and mapping based on layer 1 through layer 4 attributes, rate limiting, highly flexible scheduling, queuing and shaping options and MEF defined services.

1.2 Physical Description

1.2.1 Falcon-RX/812/G

Figure 1-1: Falcon-RX/812/G front panel

Figure 1-2: Falcon-RX/812/G back panel

Table 1-1: Falcon-RX/812/G Front Panel Description

①	12x 1/10G BaseX	⑧	LEDs indicators Link/Activity (per port)
②	8x 1/10/25G BaseX	⑨	2x Sync SMA input/output – 1PPS/10 MHz
③	1x 10/100/1000 BaseT (management)	⑩	RJ45 input/output ToD/1PPS
④	RJ45 and USB Console	⑪	LEDs indicators Sync/GNSS/CPU/Aux.
⑤	GNSS antenna TNC connector (5VDC)	⑫	Expansion module for Rubidium clock
⑥	1.5 / 2 Mbps BITS input/output	⑬	PSU1 – AC/DC options supported
⑦	LEDs indicators PSU1/PSU2	⑭	PSU2 – AC/DC options supported

1.3 Models List

Table 1-2: Falcon-RX models list

Model	Part #	Description
Falcon-RX/812/G/A	7160	Timing Aware xHaul Switch, 12x10G (SFP+), 8x25G (SFP28) ports, Advanced Timing spec w/ GNSS Rx, 1 removable AC power supply (FPS10012/A)
Falcon-RX/812/G/D	7161	Timing Aware xHaul Switch, 12x10G (SFP+), 8x25G (SFP28) ports, Advanced Timing spec w/ GNSS Rx, 1 removable DC power supply (FPS10012/D)

1.4 Typical Applications

1.4.1 5G Fronthaul & Backhaul Convergence

Evolved mobile networks requires high level of synchronization to operate. The required accuracy level increases as the networks further evolve, reaching the point the expected time error of nanoseconds is needed in the 5G Fronthaul. The Falcon-RX ability to provide this level of synchronization, on top of its line rate Ethernet forwarding, makes it the ideal Fronthaul switch. Additionally, the Falcon-RX can also provide backhaul connection to complete gNodeB units towards the 5G Core.

Figure 1-3: Falcon-RX typical xHaul application

1.4.2 IIoT Campus deployment

Modern industrial campuses and factories are being designed to accommodate high level of automation and mobility in production, which dictates specific requirement for synchronization. In such environment where, man and machine coexist and work together side by side all actions must be coordinated and mutually aware. Synchronized packet networks and time sensitive networking (TSN) are a key element in building these enrolments.

Figure 1-4: Falcon-RX in IIoT campus deployment.

2 System Description

2.1 Block Diagram

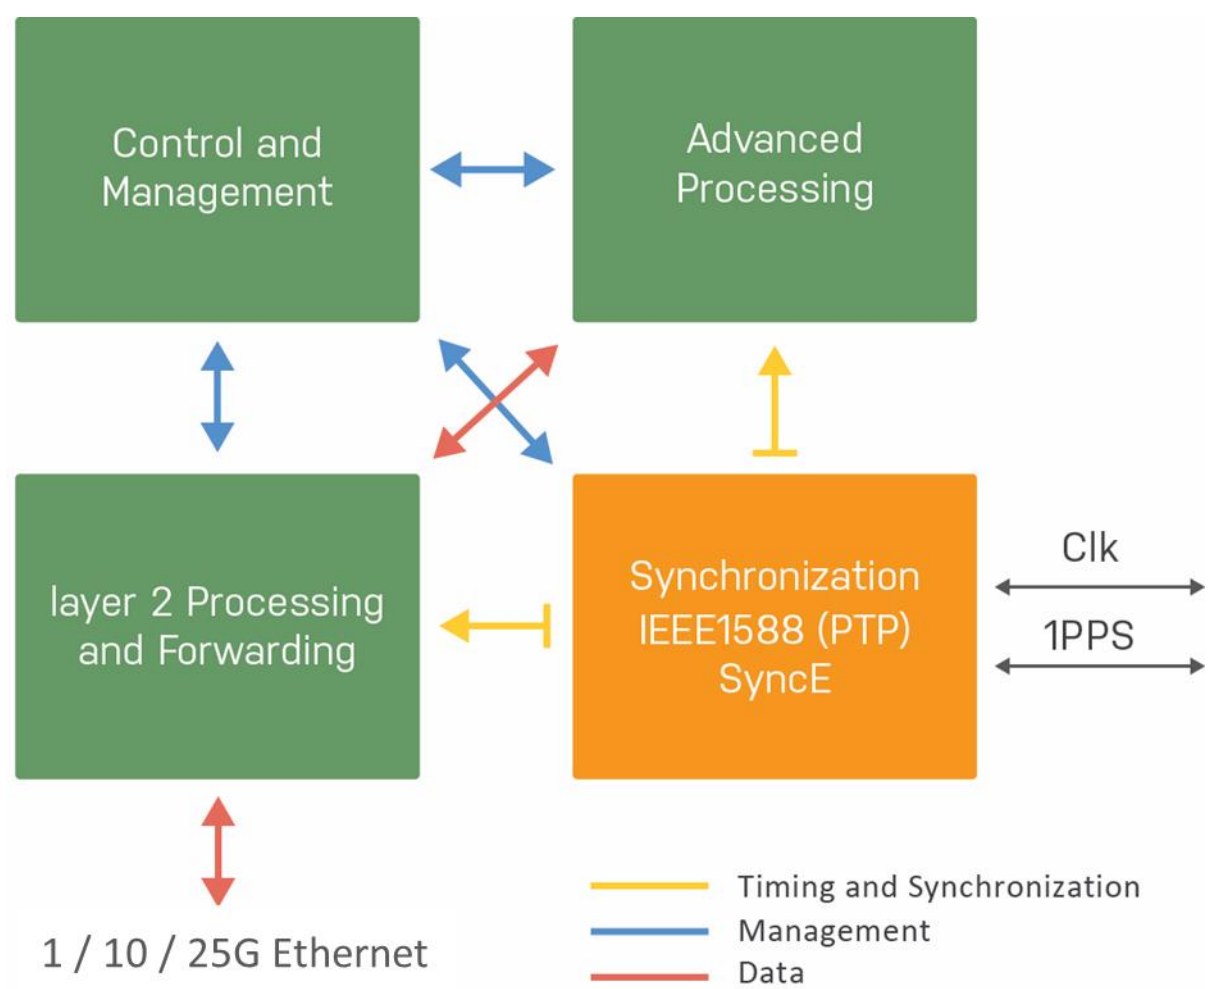

Figure 2-1: R Class functional block diagram

2.2 R Class series key features

- LTE/5G xHaul Transport and Timing RAN switch
- Integrated PTP Grandmaster
- Compatible with O-RAN architectures
- High capacity, low latency
- Extensive Sync and Timing with SyncE and PTP (PTRC/GM, BC, TC)
- Sub nanosecond timestamping, Class C/D performance
- Time Sensitive Networking support
- Based on 4th generation Falcon architecture
- Advanced QoS and service level traffic management
- Advanced OAM and management capabilities
- Multiple protection mechanisms for link, path, and ring service resilience

2.3 Management

The R Class Falcon can be remotely managed via a variety of mechanisms/ platforms at virtually no integration efforts:

IP Based (in-band): SNMP (v1/v2/v3), Telnet, SSH, Web (HTTP, HTTPS).

Console (RJ-45): RS-232 (115,200Bd), CLI (Cisco like).

OAM/IEEE802.3ah: when connected to third party edge switch that supports the standard.

2.3.1 Management integration

Integration with 3rd party network management systems can be achieved via SNMP protocol, in addition to the following standards: NTPV4, SYSLOG, RADIUS, TACACS, DHCP, LACP, LLDP.

2.3.2 OAM & Diagnostics:

- IEEE802.3ah link OAM
- IEEE802.1ag CFM
- ITU-T Y.1731 PM (HW based measurements)
- Copper TDR
- SFP diagnostics (SFF-8472)
- Traffic mirroring

2.4 R Class Falcon port features

R Class ports can be configured to support special data-plane functions. extended traffic handling capabilities, more functionality and processing power. These capabilities are Software and Firmware based and therefore field upgradeable and configurable.

The following special features are supported by the R Class series models ports:

- Synchronous Ethernet
- IEEE1588-2008 - PTP.
- MEF 20: specifies MEF User to Network Interface (UNI) Type 2.

- MEF 22.1: Mobile Backhaul Phase 2
- Per port / queue policing
- Per port / queue shaping
- Per Port Counters: The R Class models support frame and byte counters per port.
- Link OAM (IEEE802.3ah) and Service OAM (based on IEEE 802.1ag, ITU-T Y.1731)
- ITU Y.1731 data-plane support– several functions of this standard require HW based support. These functions are:
 - Loss measurement
 - Delay measurement
 - Delay variation measurement
- Linear Ethernet Protection Switching (G.8031)
- Ethernet Ring Protection Switching (G.8032v2)
- Power Link ports support the implementation of the following:

Note: The above feature list represents the current status. It is expected that further features will be added in future System Software releases

3 Getting Started

3.1 Quick Setup Outline

To set up the R Class models carry out the following steps:

- 1 Mount the device at its location (rack or desktop).
- 2 Install the SFP transceivers.
- 3 Connect the unit to a console and a power source (Figure 3-1).
- 4 Verify that the Power (PS1, PS2 or both) LEDs are green lit.
- 5 Connect required cables to ports: twisted pair (RJ45 Ethernet) and fiber (Ethernet SFPs).
- 6 Verify that the ports Link and Speed LEDs are lit per connected interfaces.
- 7 Configure the selected device via the console to assign management IP address or use default IP address (192.168.1.90)
- 8 Establish management access via SSH, Telnet or Web GUI (4.1.2).
- 9 For a general configuration procedure please refer to the Getting Started Quick Guide located at www.Fibrolan.com (Resources > Documents > Quick Guides).

Note: Remote management requires basic IP configuration.

3.2 Console Connection and Configuration

Note: Applicable to R Class series devices.

Figure 3-1: Falcon console connection

To enable basic console connection for initial setup, carry out the following steps:

1. Use an RJ-45-to-DB-9 console cable and insert the RJ-45 connector into the console port on the front panel. Alternately connect USB-to-USB from PC directly to USB port on Falcon front panel. Configure the baud rate and character format of the PC or terminal to match these console port default characteristics:
115200 baud, 8 data bits, 1 stop bit, No parity, None (flow control).
2. Connect the device to a power source and wait until it boots up.
3. The system prompts you to log in.
Default username: **moose** Default password: **1234**.

Note: if you experiment difficulty in the connection, contact Fibrolan support (International: support@Fibrolan.com; North America: Us-info@Fibrolan.com)

3.2.1 Initial IP address settings

This first configuration is done via the console; it enables the switch to connect to the IP network. Once the unit IP address is set via console, the system can be accessed through Web, Telnet, SSH or any other management options.

Initial IP setup can be implemented by manually setting the IP address Parameters or by an automatic DHCP setup (if a DHCP server is present).

To assign a new IP address to the device enter the following CLI commands:

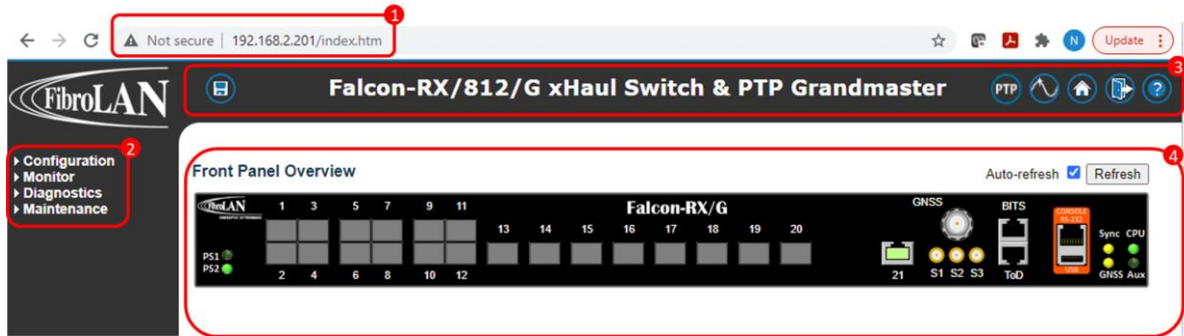

- ```
➤ configure terminal
➤ interface vlan 1
➤ ip address 192.168.1.90 255.255.255.0
```

The Falcon R class will initially boot-up with this default IP address: 192.168.1.90/24.

### 3.3 Web GUI

The Web management is accessed by setting the required IP address in the URL Browser. When accessing the devices via the Web interface, its initial Port State Overview window is displayed. as shown below.

#### Web GUI: Monitor > Ports > State

- ① IP address of device in explorer URL line.
- ② Four functionality management menus: Configuration, Monitor, Diagnostics and Maintenance
  - Configuration:** For setting all system parameters relevant to proper operation of the device.
  - Monitor:** Displays a variety of statuses from the device and other device info that enable system administrator to following up and check if the device is working properly.
  - Diagnostics:** Includes tools to diagnose and troubleshoot networking issues
  - Maintenance:** For restarting your device, returning to factory defaults and upgrading your device.

③ Main bar: consists of the following buttons:

-  **Show help:** online help specific to the displayed dynamic configuration screen.
-  **Logout:** User can end access to device web site.
-  **Home:** Access to device front panel.
-  **SyncCenter:** Control center of system synchronization interfaces and timing signal and their distribution.
-  **PTP:** Manage PTP clock instances
-  **Save running config:** After

- ④ Dynamic configuration section: Displays detailed data for the selected from one of the functionality menus.
- **Auto-refresh:** Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds
  - **Refresh:** Click to refresh the page.

# 4 Functional Description

## 4.1 Overview

This section provides introduction to the **R Class series** functionality and instructions for configuration and monitoring.

The configuration and monitoring functionalities can be accessed via various management interfaces. Section 4 demonstrates the configuration various functions and setting mainly using the Web interface. However, any configuration can be implemented using other management interfaces (CLI, Telnet, and SNMP).

## 4.2 Frame Processing Overview

This section provides a general description of the Frame Forwarding Process at the R Class series from the input port toward the output port, as illustrated below.

**Figure 4-1: Frame Forwarding Diagram**

### Input frame flow

Frames received on the input port (MAC layer) are handed to the classifiers in order to classify frames into different flows (e.g., management frames, specific service/user frames, etc.). Following the classification, the frames are passed to the Policer. If the Policer is not selected the frames pass untouched. From the Policer the frames enter the Ingress Queue. Some prioritization algorithms are used to handle traffic and to avoid buffer overrun and Frame loss.

### Output frame flow

The frames, which pass from the Ingress Queue, are transferred to the Egress Queue (8 parallel queues). The topmost queue handles management frames injected by the CPU, which have super priority over the other four queues. The remaining queues transfer data frames. At this stage, a scheduling process is taking place in order to decide which frame will be sent out of the port (out of the 8 candidate queues). For scheduling either a Strict-Priority or a Weighted Fair Queuing algorithm is being used. The output of the queue is passed to the Shaper. If the Shaper is not selected the frame passes untouched. The frames are then passed to the Rewriter. The Rewriter examines the frame header information and adjusts it if required. From there on the frame is sent to the output port (MAC layer).

### Packet forwarding

Packet forwarding decisions are based on the following criteria:

- ACL:(Access Control List) The ACL can drop a frame or redirect it to a specific port
- MAC address and VLAN: The standard Ethernet switch forwarding – a frame is forwarded by searching the learn-table and sending it to the port where the MAC-address + VLAN was learnt. If the address is not found, or the frame is a broadcast frame it will be sent to all the other member ports of the VLAN.

## 4.3 System Information

The switch system information is provided here.

The display is similar in all falcon series

### 4.3.1 System Information Configuration

Web GUI: Configuration > System > Information

#### System Information Configuration

| System Name     | Falcon               |
| System Location | <input type="text"/> |

**Figure 4-2: System Information Configuration**

**Table 4-1: System Information Configuration Parameters**

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System Contact  | The textual identification of the contact person for this managed node, together with information on how to contact this person. The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126.                                                                                                                                                                                      |
| System Name     | An administratively assigned name for this managed node. By convention, this is the node's fully qualified domain name. A domain name is a text string drawn from the alphabet (A-Za-z), digits (0-9), minus sign (-). No space characters are permitted as part of a name. The first character must be an alpha character. And the first or last character must not be a minus sign. The allowed string length is 0 to 255. |
| System Location | The physical location of this node (e.g., telephone closet, 3rd floor). The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126.                                                                                                                                                                                                                                               |

### 4.3.2 IP Configuration

Configure IP basic settings, control IP interfaces and IP routes. The maximum number of interfaces supported is 32 and the maximum number of routes is 32.

Web GUI: Configuration > System > IP

Table 4-2: IP Configuration Parameters

| IP Configuration- Basic Settings |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                             | <p><b>Configure</b> whether the IP stack should act as a <b>Host</b> or a <b>Router</b>. In <b>Host</b> mode, IP traffic between interfaces will not be routed. In <b>Router</b> mode traffic is routed between all interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DNS Server                       | <p>Controls the DNS name resolution done by the switch. There are four servers available for configuration, and the index of the server presents the preference (less index has higher priority) in doing DNS name resolution. System selects the active DNS server from configuration in turn, if the preferred server does not respond in five attempts.</p> <p>The following modes are supported:</p> <ul style="list-style-type: none"> <li>• <b>No DNS server:</b> No DNS server will be used.</li> <li>• <b>Configured IPv4:</b> Explicitly provide the valid IPv4 unicast address of the DNS Server in dotted decimal notation. Make sure the configured DNS server could be reachable (e.g., via PING) for activating DNS service</li> <li>• <b>Configured IPv6:</b> Explicitly provide the valid IPv6 unicast (except link local) address of the DNS Server. Make sure the configured DNS server could be reachable (e.g., via PING6) for activating DNS service.</li> <li>• <b>From any DHCPv4 interfaces:</b> The first DNS server offered from a DHCPv4 lease to a DHCPv4-enabled interface will be used.</li> <li>• <b>From this DHCPv4 interface:</b> Specify from which DHCPv4-enabled interface a provided DNS server should be preferred.</li> <li>• <b>From any DHCPv6 interfaces:</b> The first DNS server offered from a DHCPv6 lease to a DHCPv6-enabled interface will be used.</li> <li>• <b>From this DHCPv6 interface:</b> Specify from which DHCPv6-enabled interface a provided DNS server should be preferred.</li> </ul> |
| DNS Proxy                        | <p>When DNS proxy is enabled, system will relay DNS requests to the currently configured DNS server, and reply as a DNS resolver to the client devices on the network.</p> <p>Only IPv4 DNS proxy is currently supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Figure 4-4: IPv4 / IPv6 Configuration

Table 4-3: IP Interfaces Parameters

|                                   |                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                            | Select this option to delete an existing IP interface                                                                                                                                                                                                                                                                      |
| VLAN                              | The VLAN associated with the IP interface. Only ports in this VLAN will be able to access the IP interface. This field is only available for input when creating a new interface.                                                                                                                                          |
| IPv4 DHCP Enabled                 | Enable the DHCPv4 client by checking this box. If this option is enabled, the system will configure the IPv4 address and mask of the interface using the DHCPv4 protocol. The DHCPv4 client will announce the configured System Name as hostname to provide DNS lookup                                                     |
| IPv4 DHCP Client Identifier Type  | This specified which of the three types below, i.e., IfMac, ASCII or HEX, shall be used for the Client Identifier. See RFC-2132 section 9.14.                                                                                                                                                                              |
| IPv4 DHCP Client Identifier IfMac | The interface name of DHCP client identifier. When DHCPv4 client is enabled and the client identifier type is 'ifMac', the configured interface's hardware MAC address will be used in the DHCP option 61 field.                                                                                                           |
| IPv4 DHCP Client Identifier ASCII | The ASCII string of DHCP client identifier. When DHCPv4 client is enabled and the client identifier type is 'ascii', the ASCII string will be used in the DHCP option 61 field.                                                                                                                                            |
| IPv4 DHCP Client Identifier HEX   | The hexadecimal string of DHCP client identifier. When DHCPv4 client is enabled and the client identifier type 'hex', the hexadecimal value will be used in the DHCP option 61 field.                                                                                                                                      |
| IPv4 DHCP Hostname                | The hostname of DHCP client. If DHCPv4 client is enabled, the configured hostname will be used in the DHCP option 12 field. When this value is empty string, the field use the configured system name plus the latest three bytes of system MAC addresses as the hostname.                                                 |
| IPv4 DHCP Fallback Timeout        | The number of seconds for trying to obtain a DHCP lease.<br><br>After this period expires, a configured IPv4 address will be used as IPv4 interface address. A value of zero disables the fallback mechanism, such that DHCP will keep retrying until a valid lease is obtained. Legal values are 0 to 4294967295 seconds. |
| IPv4 DHCP Current Lease           | For DHCP interfaces with an active lease, this column shows the current interface address, as provided by the DHCP server.                                                                                                                                                                                                 |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv4 Address         | The IPv4 address of the interface in dotted decimal notation. If <b>DHCP</b> is enabled, this field configures the fallback address. The field may be left blank if IPv4 operation on the interface is not desired - or no DHCP fallback address is desired.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| IPv4 Mask            | The IPv4 network mask, in number of bits ( <i>prefix length</i> ). Valid values are between 0 and 30 bits for a IPv4 address. If <b>DHCP</b> is enabled, this field configures the fallback address network mask. The field may be left blank if IPv4 operation on the interface is not desired - or no DHCP fallback address is desired.                                                                                                                                                                                                                                                                                                                                                                            |
| DHCPv6 Enable        | Enable the DHCPv6 client by checking this box. If this option is enabled, the system will configure the IPv6 address of the interface using the DHCPv6 protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DHCPv6 Rapid Commit  | Enable the DHCPv6 Rapid-Commit option by checking this box. If this option is enabled, the DHCPv6 client terminates the waiting process as soon as a Reply message with a Rapid Commit option is received.<br><br>This option is only manageable when DHCPv6 client is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DHCPv6 Current Lease | For DHCPv6 interface with an active lease, this column shows the interface address provided by the DHCPv6 server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IPv6 Address         | The IPv6 address of the interface. A IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:).<br><br>For example, 2001:1::90.<br><br>The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of contiguous zeros; but it can appear only once. System accepts the valid IPv6 unicast address only, except IPv4-Compatible address and IPv4-Mapped address.<br><br>The field may be left blank if IPv6 operation on the interface is not desired.                                                                                                                               |
| IPv6 Mask            | The IPv6 network mask, in number of bits ( <i>prefix length</i> ). Valid values are between 1 and 128 bits for a IPv6 address. The field may be left blank if IPv6 operation on the interface is not desired.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Resolving IPv6 DAD   | The link-local address is formed from an interface identifier based on the hardware address which is supposed to be uniquely assigned. Once the DAD (Duplicate Address Detection) detects the address duplication, the operation on the interface SHOULD be disabled.<br><br>At this moment, manual intervention is required to resolve the address duplication. For example, check whether the loop occurs in the VLAN or there is indeed other device occupying the same hardware address as the device in the VLAN.<br><br>After making sure the specific link-local address is unique on the IPv6 link in use, delete and then add the specific IPv6 interface to restart the IPv6 operations on this interface. |
| Buttons              | <b>Add Interface:</b> Click to add a new IP interface. A maximum of 8 interfaces is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 4.3.4 IP Routes

Web GUI: Configuration > System > IP

#### IP Routes

| Delete                   | Network      | Mask Length | Gateway       | Distance(IPv4) / Next Hop VLAN(IPv6) |
|--------------------------|--------------|-------------|---------------|--------------------------------------|
| <input type="checkbox"/> | 0.0.0.0      | 0           | 192.168.5.1   | 1                                    |
| <input type="checkbox"/> | 192.168.50.0 | 24          | 192.168.5.185 | 1                                    |

Figure 4-5: IP Routes

Table 4-4: IP Routes Parameters

|                               |                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                        | Select this option to delete an existing IP route.                                                                                                                                                                                                                                                                                                                                          |
| Network                       | The destination IP network or host address of this route. Valid format is dotted decimal notation or a valid IPv6 notation. A default route can use the value 0.0.0.0 or IPv6:: notation.                                                                                                                                                                                                   |
| Mask Length                   | The destination IP network or host mask, in number of bits (prefix length). It defines how much of a network address that must match, in order to qualify for this route. Valid values are between 0 and 32 bits respectively 128 for IPv6 routes. Only a default route will have a mask length of 0 (as it will match anything).                                                           |
| Gateway                       | The IP address of the IP gateway. Valid format is dotted decimal notation for a valid IPv6 notation. Gateway and Network must be of the same type.                                                                                                                                                                                                                                          |
| Distance (Only for IPv4)      | The distance value of route entry is used to provide the priority information of the routing protocols to routers. When there are two or more different routing protocols are involved and have the same destination, the distance value can be used to select the best path.                                                                                                               |
| Next Hop VLAN (Only for IPv6) | The VLAN ID (VID) of the specific IPv6 interface associated with the gateway. The given VID ranges from 1 to 4095 and will be effective only when the corresponding IPv6 interface is valid. If the IPv6 gateway address is link-local, it must specify the next hop VLAN for the gateway. If the IPv6 gateway address is not link-local, system ignores the next hop VLAN for the gateway. |
| Buttons                       | <b>Add Route</b> Click to add a new IP route. A maximum of 32 routes is supported.                                                                                                                                                                                                                                                                                                          |

### 4.3.5 NTP Configuration

NTP is an acronym for **N**etwork **T**ime **P**rotocol, a network protocol for synchronizing the clocks of computer systems. NTP uses UDP (datagrams) as transport layer. The Falcon-RX supports both client and server functions of the protocol.

#### NTP Configuration

|             |                                                                                                               |

Figure 4-6: System Time Display

### 4.3.5.1 NTP Client Configuration

The NTP client configuration allows the switch to set the IP address of up to 5 different NTP servers as a time source. Additionally, server polling interval and encryption options can be configured. Maximum and minimum polling values in seconds are between 8-131072(approximately 36.4 hours).

**Web GUI: Configuration > Timing > NTP**

**Figure 4-12: System Log Configuration displays**

**Table 4-10: System Log Configuration Parameters**

| System Log Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server Mode              | <p>Indicates the server mode operation. When the mode operation is enabled, the syslog message will send out to syslog server. The syslog protocol is based on UDP communication and received on UDP port 514, and the syslog server will not send acknowledgments back sender since UDP is a connectionless protocol and it does not provide acknowledgments. The syslog packet will always send out even if the syslog server does not exist. Possible modes are:</p> <p><b>Enabled:</b> Enable server mode operation.</p> <p><b>Disabled:</b> Disable server mode operation.</p>      |
| Server Address           | <p>Indicates the IPv4 host address of syslog server. If the switch provides DNS feature, it also can be a domain name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Syslog Level             | <p>Indicates what kind of message will send to syslog server. Possible modes are:</p> <ul style="list-style-type: none"> <li>• <b>Error:</b> Send the specific messages which severity code is less or equal than Error (3).</li> <li>• <b>Warning:</b> Send the specific messages which severity code is less or equal than Warning (4).</li> <li>• <b>Notice:</b> Send the specific messages which severity code is less or equal than Notice (5).</li> <li>• <b>Informational:</b> Send the specific messages which severity code is less or equal than Informational (6).</li> </ul> |

### 4.3.8 Events

This page allows the user to change (enable/disable) and their corresponding interfaces to the current events configuration.

**Web GUI: Configuration > System > Events**

**Events Configuration**

| #  | Event                                   | Severity | Enable                              | Interface                           |                                     |                                     |                                     |                                     | Status | Counter | Clear |

| Port             | This is the logical port number for this row.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Link             | The current link state is displayed graphically. <ul style="list-style-type: none"> <li>• “Green” indicates that the link is up.</li> <li>• “Red” indicates that the link is down.</li> <li>• “Grey” Indicates that the port is inactive</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Current Speed    | Provides the current link speed of the port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Configured Speed | Selects available link speed for the given switch port. Only speeds supported by the specific port are shown. Possible speeds are: <ul style="list-style-type: none"> <li>• <b>Disabled</b> - Disables the switch port operation.</li> <li>• <b>Auto</b> - Port auto negotiating speed and duplex with the link partner and selects the highest speed that is compatible with the link partner.</li> <li>• <b>10Mbps HDX</b> - Forces Cu port in 10Mbps half-duplex mode.</li> <li>• <b>10Mbps FDX</b> - Forces Cu port in 10Mbps full duplex mode.</li> <li>• <b>100Mbps HDX</b> - Forces Cu port in 100Mbps half-duplex mode.</li> <li>• <b>100Mbps FDX</b> - Forces Cu port in 100Mbps full duplex mode.</li> <li>• <b>1Gbps FDX</b> - Forces port in 1Gbps full duplex mode.</li> <li>• <b>2.5Gbps FDX</b> - Forces port in 2.5Gbps full duplex mode.</li> <li>• <b>10Gbps FDX</b> - Forces port in 10Gbps full duplex mode.</li> <li>• <b>25Gbps FDX</b> - Forces port in 25Gbps full duplex mode.</li> </ul> |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cable Type               | <p><b>AutoSFP</b> interface in "auto" mode. Automatic SerDes tuning for optical and DAC-3m cables.</p> <p><b>DAC-1mSFP</b> interface in "DAC-1m" mode. Manual SerDes tuning specifically for DAC-1m cables.</p> <p><b>DAC-2mSFP</b> interface in "DAC-2m" mode. Manual SerDes tuning specifically for DAC-2m cables.</p> <p><b>DAC-3mSFP</b> interface in "DAC-3m" mode. Manual SerDes tuning specifically for DAC-3m cables.</p> <p><b>DAC-5mSFP</b> interface in "DAC-5m" mode. Manual SerDes tuning specifically for DAC-5m cables.</p>                                                                                                                                                                                                                                                                                                   |
| Advertise Duplex         | When duplex is set as auto i.e., auto negotiation, the port will only advertise the specified duplex as either <b>FDX</b> or <b>HDX</b> to the link partner. By default, port will advertise all the supported duplexes if the Duplex is Auto.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Advertise Speed          | When speed is set as auto, i.e., auto negotiation, the port will only advertise the specified speeds ( <b>10M, 100M, 1G, 2.5G, 10G, 25G</b> ) to the link partner. By default, port will advertise all the supported speeds if speed is set as Auto.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Flow Control             | <p>When “<b>Auto Speed</b>” is selected for a port, this section indicates the flow control capability that is advertised to the link partner.</p> <p>When a fixed speed setting is selected, traffic that is what is selected.</p> <p><b>Current Rx:</b> This column indicates whether pause frames on the port are obeyed.</p> <p><b>Current Tx:</b> This column indicates whether pause frames on the port are transmitted.</p> <p>The Rx and Tx settings are determined by the result of the last <u>Auto-Negotiation</u>.</p> <p><b>Configured:</b> Check the configured column to use flow control; this setting is related to the setting for <b>Configured Link Speed</b>. NOTICE: The 100FX standard does not support Auto Negotiation, so when in 100FX mode the flow control capabilities will always be shown as “disabled”.</p> |
| PFC                      | When PFC (802.1Qbb Priority Flow Control) is enabled on a port then flow control on a priority level is enabled. Through the <b>Priority</b> field, range (one or more) of priorities can be configured, e.g., ‘0-3,7’ which equals ‘0,1,2,3,7’. PFC is not supported through auto negotiation. PFC and Flow control cannot both be enabled on the same port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Maximum Frame Size       | Enter the maximum frame size allowed for the switch port, including FCS. The range is 1518-9600 bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Excessive Collision Mode | <p>Configure port transmit collision behavior:</p> <p><b>Discard:</b> Discards frame after 16 collisions (default).</p> <p><b>Restart:</b> Restarts backoff algorithm after 16 collisions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description        | Indicates the description of the port. Maximum length of the Port description String is 64. Port description can be null. When port description is not null, it cannot contain space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Frame Length Check | Configures if frames with incorrect frame length in the EtherType/Length field shall be dropped. An Ethernet frame contains a field EtherType which can be used to indicate the frame payload size (in bytes) for values of 1535 and below. If the EtherType/Length field is above 1535, it indicates that the field is used as an EtherType (indicating which protocol is encapsulated in the payload of the frame). If "frame length check" is enabled, frames with payload size less than 1536 bytes are dropped, if the EtherType/Length field doesn't match the actual payload length. If "frame length check" is disabled, frames are not dropped due to frame length mismatch. Note: No drop counters count frames dropped due to frame length mismatch |
| RS-FEC / FEC Mode  | Toggle Enable/Disable Reed-Solomon Forward Error Correction                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### 4.4.1 Port State

This section provides an overview of the current switch port states (Each R Class series device has its own Port State display).

Front Panel Overview

Figure 4-15: Port State

The port states are illustrated as follows:

### 4.4.2 SFP Information

This section shows SFP Information.

**Web GUI: Monitor > Ports > SFP Info**

#### SFP Information

| Port | Vendor   | Part #  | Type | Range | Wavelength (nm) |         | Serial #     |
|------|----------|---------|------|-------|-----------------|---------|--------------|
|      |          |         |      |       | Transmit        | Receive |              |
| 5    |          |         |      |       |                 |         |              |
| 6    |          |         |      |       |                 |         |              |
| 7    |          |         |      |       |                 |         |              |
| 8    | FibroLAN | SF1G-S1 | MM   | 550m  | 850             | 850     | B2351512LTS0 |
| 9    |          |         |      |       |                 |         |              |
| 10   |          |         |      |       |                 |         |              |

Auto-refresh  Refresh

**Figure 4-16: SFP information**

**Table 4-13: SFP Information Parameters**

|            |                                                                     |
|------------|---------------------------------------------------------------------|
| Vendor #   | Indicates vendor's name.                                            |
| Part #     | Indicates part number.                                              |
| Type       | Indicates module Type.                                              |
| Range      | Indicates the SFP's nominal optical range.                          |
| Wavelength | Indicates the SFP wavelength (separately for transmit and receive). |
| Serial     | Indicates the SFP's serial number.                                  |

### 4.4.3 SFP Operational Range

This section shows SFP operational range.

#### SFP Operational Range

| Port | Status | Rx Power  | Tx Power | Temperature | Bias current | Supply voltage |
|------|--------|-----------|----------|-------------|--------------|----------------|
| 5    | ●      | Unplugged |          |             |              |                |
| 6    | ●      | Unplugged |          |             |              |                |
| 7    | ●      | Unplugged |          |             |              |                |
| 8    | ●      | Unplugged |          |             |              |                |
| 9    | ●      | Unplugged |          |             |              |                |
| 10   | ●      | Unplugged |          |             |              |                |

Auto-refresh  Refresh

If you insert SFPs into ports 7 and 8 you get the following display which shows the operational range. The red indicators under status imply a low Rx error since there is no reception.

Web GUI: Monitor > Ports > SFP Op Range

SFP Operational Range

| Port | Status | Rx Power       | Tx Power        | Temperature | Bias current  | Supply voltage |
|------|--------|----------------|-----------------|-------------|---------------|----------------|
| 5    |        |                |                 | Unplugged   |               |                |
| 6    |        |                |                 | Unplugged   |               |                |
| 7    |        | -24.0 ~ 0.0dbm | -10.0 ~ -3.0dbm | -45 ~ 90°C  | 0.0 ~ 100.0mA | 2.70 ~ 3.80V   |
| 8    |        | -24.0 ~ 0.0dbm | -10.0 ~ -3.0dbm | -45 ~ 90°C  | 0.0 ~ 100.0mA | 2.70 ~ 3.80V   |
| 9    |        |                |                 | Unplugged   |               |                |
| 10   |        |                |                 | Unplugged   |               |                |

|       |                                                                   |
|-------|-------------------------------------------------------------------|
| Port  | The logical port for the settings contained in the same row.      |
| Qn    | There are 8 QoS queues per port. Q0 is the lowest priority queue. |
| Rx/Tx | The number of received and transmitted packets per queue.         |

By clicking selected port number, you get its detailed port statistics page. For details, refer to [Detailed Port Statistics](#).

### 4.4.7 QoS Control List Status

This section shows the QCL status by different QCL users. Each row describes the **QCE** that is defined. It is a conflict if a specific QCE is not applied to the hardware due to hardware limitations. The maximum number of QCEs is **256** on each switch.

QCL is an acronym for **QoS Control List**. It is the list table of QCEs, containing QoS control entries that classify to a specific QoS class on specific traffic objects. Each accessible traffic object contains an identifier to its QCL. The privileges determine specific traffic object to specific QoS class.

**QCE** is an acronym for **QoS Control Entry**. It describes QoS class associated with a particular QCE ID. There are six QCE frame types: Ethernet Type, VLAN, UDP/TCP Port, DSCP, TOS, and Tag Priority. Frames can be classified by one of 4 different QoS classes: "Low", "Normal", "Medium", and "High" for individual application.

Web GUI: Monitor > Ports > QCL Status

**QoS Control List Status**

| User       | QCE | Port | Frame Type | Action |     |      |     |     |        | Conflict |
|------------|-----|------|------------|--------|-----|------|-----|-----|--------|----------|
|            |     |      |            | CoS    | DPL | DSCP | PCP | DEI | Policy |          |
| No entries |     |      |            |        |     |      |     |     |        |          |

|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User       | Indicates the QCL user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| QCE        | Indicates the index of QCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Frame type | Indicates the type of frame to look for incoming frames. Possible frame types are: <ul style="list-style-type: none"> <li>• <b>Any</b>: Match any frame type.</li> <li>• <b>Ethernet</b>: Match Ether type frames.</li> <li>• <b>LLC</b>: Match (LLC) frames</li> <li>• <b>SNAP</b>: Match (SNAP) frames</li> <li>• <b>IPv4</b>: Match IPV4 frames.</li> <li>• <b>IPv6</b>: Match IPV6 frames.</li> </ul>                                                                                                                              |
| Port       | Indicates the list of ports configured with the QCE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Action     | Indicates the classification action taken on ingress frame if Parameters configured are matched with the frame's content. <ul style="list-style-type: none"> <li>• There are three action fields: Class, DPL and DSCP.</li> <li>• CoS: Classify Class of Service</li> <li>• DPL: Classify Drop Precedence Level</li> <li>• DSCP: Classify DSCP value</li> <li>• PCP: Classify PCP value</li> <li>• DEI: Classify DEI value.</li> <li>• Policy: Classify ACL Policy number.</li> <li>• Ingress Map: Classify Ingress Map ID.</li> </ul> |
| Conflict   | Displays Conflict status of QCL entries. As H/W resources are shared by multiple applications. It may happen that the resources required to add a QCE may not be available, in that case it shows conflict status as 'Yes', otherwise it is always 'No'. Please note that conflict can be resolved by releasing the H/W resources required to add QCL entry on pressing 'Resolve Conflict' button.                                                                                                                                     |
| Buttons    | <b>Combined</b> : Select the QCL status from this drop-down list<br><br><b>Resolve Conflict</b> : Click to release the resources required to add QCL entry in case the conflict status for any QCL entry is 'yes'.                                                                                                                                                                                                                                                                                                                     |

#### 4.4.8 Detailed Port Statistics

This section provides detailed traffic statistics for a specific switch port. Use the port select box to select which switch port details to display.

The displayed counters are the totals for receive and transmit, the size counters for receive and transmit, and the error counters for receive and transmit.

Web GUI: Monitor > Ports > QCL Status

Detailed Port Statistics Port 1

| Receive Total          |        | Transmit Total          |        |
|------------------------|--------|-------------------------|--------|
| Rx Packets             | 5819   | Tx Packets              | 1106   |

#### 4.4.9 Green Ethernet

This page allows the user to configure the port power savings features.

EEE is an abbreviation for Energy Efficient Ethernet defined in IEEE 802.3az. EEE is a power saving option that reduces the power usage when there is low or no traffic utilization.

EEE works by powering down circuits when there is no traffic. When a port gets data to be transmitted all circuits are powered up. The time it takes to power up the circuits is named wakeup time. The default wakeup time is 17 us for 1Gbit links and 30 us for other link speeds. EEE devices must agree upon the value of the wakeup time in order to make sure that both the receiving and transmitting device has all circuits powered up when traffic is transmitted. The devices can exchange wakeup time information using the LLDP protocol.

EEE works for ports in auto-negotiation mode, where the port is negotiated to either 1G or 100 Mbit full duplex mode.

For ports that are not EEE-capable the corresponding EEE checkboxes are grayed out and thus impossible to enable EEE for.

The EEE port settings relate to the currently selected stack unit, as reflected by the page header.

When a port is powered down for saving power, outgoing traffic is stored in a buffer until the port is powered up again. Because there are some overheads in turning the port down and up, more power can be saved if the traffic can be buffered up until a large burst of traffic can be transmitted. Buffering traffic will give some latency in the traffic.

---

*Note: For Port Power Savings refer to "[Port Power Savings Configuration](#)"*

---

For Port Power Savings Status, refer to "[Port Power Saving Status](#)".

#### 4.4.10 Thermal Protection

For Thermal Protection Configuration, refer to "[Thermal Protection Configuration](#)".

For Thermal Protection Status, refer to "[Thermal Protection Status](#)".

## 4.5 MAC Learning Table

This section details the MAC Learn Table functionality.

Switching of frames is based upon the DMAC address contained in the frame. The switch builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should be delivered to (Based upon the DMAC address in the frame). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address (SMAC address), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address has been seen after a configurable age time.

The R Class series MAC address space is up to 8K addresses.

### 4.5.1 Configuring the MAC Address Table

The MAC Address Table is configured on this section. Set timeouts for entries in the dynamic MAC Table and configure the static MAC table

By default, the R Class series is configured for automatic learning on all ports. The table is sorted first by VLAN ID, then by MAC address.

Timeouts are set for entries in the dynamic MAC address and Configuration is performed in the static MAC table.

#### Web GUI: Configuration > MAC Table

##### MAC Address Table Configuration

###### Aging Configuration

|                         |                          |
|-------------------------|--------------------------|
| Disable Automatic Aging | <input type="checkbox"/> |
| Aging Time              | 300 seconds              |

###### MAC Table Learning

|         | Port Members                     |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |

| Aging Configuration         | <p>By default, dynamic entries are removed from the MAC after 300 seconds. This removal is also called aging.</p> <p>Configure aging time by entering a value here in seconds; for example, <b>Age Time:</b> <input type="text"/> seconds.</p> <p>The allowed range is 10 to 10000000 seconds.</p> <p>Check this box to disable the automatic aging of dynamic entries. <b>Disable Automatic Aging.</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MAC Table Learning          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MAC Table Learning          | <p>If the learning mode for a given port is grayed out, another module is in control of the mode, so that it cannot be changed by the user. An example of such a module is the MAC-Based Authentication under 802.1X. Each port is capable of learning based upon the following settings:</p> <p><b>Auto:</b> Learning is done automatically as soon as a frame with an unknown SMAC is received.</p> <p><b>Disable:</b> No learning is done.</p> <p><b>Secure:</b> Only static MAC entries are learned; all other frames are dropped.</p> <hr/> <p><i><b>Note:</b> Make sure that the link used for managing the switch is added to the Static Mac Table before changing to secure learning mode, otherwise the management link is lost and can only be restored by using another non-secure port or by connecting to the switch via the serial interface.</i></p> <hr/> |
| VLAN Learning Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Learning-disabled VLANs     | <p>This field shows the Learning-disabled VLANs. When a NEW MAC arrives to a learning-disabled VLAN, the MAC won't be learnt. By the default, the field is empty. More VLANs may be created by using a list syntax where the individual elements are separated by commas. Ranges are specified with a dash separating the lower and upper bound.</p> <p>The following example will create VLANs 1, 10, 11, 12, 13, 200, and 300: 1,10-13,200,300. Spaces are allowed in between the delimiters.</p>                                                                                                                                                                                                                                                                                                                                                                       |

| Static MAC Table Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static MAC Table Configuration | <p>The static entries in the MAC table are shown in this table.</p> <p>The static MAC table can contain up to a maximum 64 entries.</p> <p>The MAC table is sorted first by VLAN ID and then by MAC address.</p> <p><b>Delete:</b> Check to delete the entry. It will be deleted during the next save.</p> <p><b>VLAN ID:</b> The VLAN ID for the entry.</p> <p><b>MAC Address:</b> The MAC address for the entry.</p> <p><b>Port Members:</b> Checkmarks indicate which ports are members of the entry. Check or uncheck as needed to modify the entry.</p> <p><b>Add a new static entry:</b> Click to <b>Add New Static Entry</b> to add a new entry to the static MAC table. Specify the VLAN ID, MAC address, and port members for the new entry. Click <b>Save</b>.</p> |

### 4.5.2 Monitoring the MAC Address Table

Entries in the MAC Table are shown in the below figure. The MAC Table contains up to 32768 entries, and is sorted first by VLAN ID, then by MAC address.

**Web GUI: Monitor > MAC Table**

#### MAC Address Table

Start from VLAN  and MAC address  with  entries per page.

| Type    | VLAN | MAC Address       | CPU | Port Members |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |
|---------|------|-------------------|-----|--------------|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|

Figure 4-24: Monitoring MAC Address Table

### 4.5.3 Navigating the MAC Table

Each page shows up to 999 entries from the MAC table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MAC Table. The first displayed will be the one with the lowest VLAN ID and the lowest MAC address found in the MAC Table.

The **Start from MAC address** and **VLAN** input fields allow the user to select the starting point in the MAC Table.

Clicking the **Refresh** button will update the displayed table starting from that or the closest next MAC Table match.

In addition the two input fields will, upon a **Refresh** button click, the Start from VLAN and MAC address fields assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The [**>>**] button will use the last entry of the currently displayed VLAN/MAC address pairs as a basis for the next lookup.

When the end is reached the text “no more entries” is shown in the displayed table. Use the [**<<**] button to start over.

**Table 4-21: MAC Address Table Configuration Parameters**

| MAC Table Columns |                                                           |
|-------------------|-----------------------------------------------------------|
| Type              | Indicates whether the entry is a static or dynamic entry. |
| VLAN              | The VLAN ID of the entry.                                 |
| MAC Address       | The MAC address of the entry.                             |
| Port Members      | The ports that are members of the entry.                  |

## 4.6 VLANs and Provider Bridges

Virtual LAN, commonly known as VLAN, is a group of hosts with a common set of requirements that communicate as if they were attached to the same LAN, regardless of their physical location. A VLAN has the same attributes as a physical LAN, but allows for end stations to be grouped together even if they are not located on the same LAN segment. Network reconfiguration can be done through software instead of physically relocating devices.

A VLAN can be thought of as a broadcast domain that exists within a defined set of switches. Ports on a switch can be grouped into VLANs in order to limit traffic flooding since it is limited to ports belonging to that VLAN and its ports. Any switch port can belong to a VLAN. Frames are forwarded and flooded only to ports in the same VLAN. Each VLAN is a logical network, and packets destined for stations that do not belong to the same VLAN must be forwarded through a router.

VLANs are essentially Layer 2 constructs, whereas IP subnets are Layer 3 constructs. In a LAN employing VLANs, a one-to-one relationship often exists between VLANs and IP subnets, although it is possible to have multiple subnets on one VLAN or have one subnet spread across multiple VLANs. Virtual LANs and IP subnets provide independent Layer 2 and Layer 3 constructs that map to one another, and this correspondence is useful during the network design process.

In Metro-Ethernet applications VLANs are being used to enable service separation: each VLAN relates to a different service while disallowing different services/users to communicate with each other. The usage of VLANs to enable Metro Ethernet services is further enhanced by the Provider Bridges approach which uses QinQ capabilities as described in Section [Provider Bridges \(QinQ\)](#).

### 4.6.1 VLAN Configuration

This section allows for controlling VLAN configuration on the switch. The section includes Global VLAN Configuration and –Port VLAN configurations.

**Web GUI: Configuration > VLANs > Configuration**

#### Global VLAN Configuration

|                                     |      |
|-------------------------------------|------|
| <b>Allowed Access VLANs</b>         | 1    |
| <b>Ethertype for Custom S-ports</b> | 88A8 |

**Figure 4-25: Global VLAN Configuration**

**Table 4-22: Global VLAN Configuration Parameters**

| Global VLAN Configuration    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allowed Access VLANs         | <p>This field shows the allowed <b>Access VLANs</b>, i.e., it only affects ports configured as Access ports (the default port mode).</p> <p>Ports in other modes are members of all VLANs specified in the <b>Allowed VLANs</b> field (Ports in Trunk and Hybrid mode). By default, only VLAN 1 is enabled. More VLANs may be created by using a list syntax where the individual elements are separated by commas.</p> <p>Ranges are specified with a dash separating the lower and upper bound. The following example will create VLANs 1, 10, 11, 12, 13, 200, and 300: <b>1,10-13, 200, 300</b>. Spaces are allowed in between the delimiters</p> |
| Ethertype for Custom S ports | <p>This field specifies the ethertype/TPID (specified in hexadecimal) used for Custom S-ports. The setting is in force for all ports whose Port Type is set to S-Custom-Port.</p> <p>S-Custom-Port:</p> <p>On ingress, frames with a VLAN tag with a TPID = 0x8100 or equal to the Ethertype configured for Custom-S ports get classified to the VLAN ID embedded in the tag. If a frame is untagged or priority tagged, the frame is classified to the Port VLAN. If frames must be tagged on egress, they will be tagged with the custom S-tag.</p>                                                                                                 |

### 4.6.1.1 VLAN Port Configuration

The VLAN Port Configuration is used to configure per port VLAN related Parameters.

#### Web GUI: Configuration > VLANs > Configuration

##### Global VLAN Configuration

|                              |      |
|------------------------------|------|
| Allowed Access VLANs         | 1    |
| Ethertype for Custom S-ports | 88A8 |

##### Port VLAN Configuration

| Port | Mode     | Port VLAN | Port Type | Ingress Filtering                   | Ingress Acceptance    | Egress Tagging | Allowed VLANs | Forbidden VLANs |
|------|----------|-----------|-----------|-------------------------------------|-----------------------|----------------|---------------|-----------------|

Spaces are allowed in between the delimiters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Ethernet for Custom S ports | <p>This field specifies the ethertype/TPID (specified in hexadecimal) used for Custom S-ports. The setting is in force for all ports whose Port Type is set to S-Custom-Port.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Port VLAN Configuration     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Port                        | <p>This is the logical port number for this row.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Mode                        | <p>The port mode (default is Access) determines the fundamental behavior of the port in question. A port can be in one of three modes as described below. Whenever a particular mode is selected, the remaining fields in that row will be either grayed out or made changeable depending on the mode in question. Grayed out fields show the value that the port will get when the mode is applied</p> <p><b><u>Access:</u></b></p> <p>Access ports are normally used to connect to end stations. Dynamic features like Voice VLAN may add the port to more VLANs behind the scenes. Access ports have the following characteristics:</p> <ol style="list-style-type: none"> <li>1. Member of exactly one VLAN, the Port VLAN (a.k.a. Access VLAN), which by default is 1.</li> <li>2. Accepts untagged and C-tagged frames.</li> <li>3. Discards all frames that are not classified to the Access VLAN</li> <li>4. On egress all frames are transmitted untagged.</li> </ol> <p><b><u>Trunk:</u></b></p> <p>Trunk ports can carry traffic on multiple VLANs simultaneously and are normally used to connect to other switches. Trunk ports have the following characteristics:</p> <ol style="list-style-type: none"> <li>1. By default, a trunk port is member of all VLANs (1-4095).</li> <li>2. The VLANs that a trunk port is member of may be limited using Allowed VLANs.</li> <li>3. Frames classified to a VLAN that the port is not a member of are discarded.</li> </ol> |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <p>4. By default, all frames but frames classified to the Port VLAN (a.k.a. Native VLAN) get tagged on egress. Frames classified to the Port VLAN do not get C-tagged on egress.</p> <p>5. Egress tagging can be changed to tag all frames, in which case only tagged frames are accepted on ingress.</p> <p><b>Hybrid:</b></p> <p>Hybrid ports resemble trunk ports in many ways but adds additional port configuration features. In addition to the characteristics described for trunk ports, hybrid ports have these abilities:</p> <ol style="list-style-type: none"> <li>1. Can be configured to be VLAN tag unaware or, C-tag aware, S-tag aware, or S-custom-tag aware.</li> <li>2. Ingress filtering can be controlled.</li> <li>3. Ingress acceptance of frames and configuration of egress tagging can be configured independently.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>Port VLAN</p> | <p>Determines the port's VLAN ID (a.k.a. PVID). Allowed VLANs are in the range 1 through 4095, default being 1. On ingress, frames get classified to the Port VLAN if the port is configured as VLAN unaware, the frame is untagged, or VLAN awareness is enabled on the port, but the frame is priority tagged (VLAN ID = 0). On egress, frames classified to the Port VLAN do not get tagged if Egress Tagging configuration is set to untag Port VLAN. The Port VLAN is called an "Access VLAN" for ports in Access mode and Native VLAN for ports in Trunk or Hybrid mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p>Port Type</p> | <p>Ports in hybrid mode allow for changing the port type, that is, whether a frame's VLAN tag is used to classify the frame on ingress to a particular VLAN, and if so, which TPID it reacts on. Likewise, on egress, the Port Type determines the TPID of the tag, if a tag is required.</p> <p><b>Unaware:</b></p> <p>On ingress, all frames, whether carrying a VLAN tag or not, get classified to the Port VLAN, and possible tags are not removed on egress.</p> <p><b>C-Port:</b></p> <p>On ingress, frames with a VLAN tag with TPID = 0x8100 get classified to the VLAN ID embedded in the tag. If a frame is untagged or priority tagged, the frame gets classified to the Port VLAN. If frames must be tagged on egress, they will be tagged with a C-tag.</p> <p><b>S-Port:</b></p> <p>On ingress, frames with a VLAN tag with TPID = 0x8100 or 0x88A8 get classified to the VLAN ID embedded in the tag. If a frame is untagged or priority tagged, the frame gets classified to the Port VLAN. If frames must be tagged on egress, they will be tagged with an S-tag.</p> <p><b>S-Custom-Port:</b></p> <p>On ingress, frames with a VLAN tag with a TPID = 0x8100 or equal to the Ethertype configured for Custom-S ports get classified to the VLAN ID embedded in the tag. If a frame is untagged or priority tagged, the frame</p> |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | gets classified to the Port VLAN. If frames must be tagged on egress, they will be tagged with the custom S-tag.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Ingress Filtering  | Hybrid ports allow for changing ingress filtering. Access and Trunk ports always have ingress filtering enabled. If ingress filtering is enabled (checkbox is checked), frames classified to a VLAN that the port is not a member of get discarded. If ingress filtering is disabled, frames classified to a VLAN that the port is not a member of are accepted and forwarded to the switch engine. However, the port will never transmit frames classified to VLANs that it is not a member of.                                                                    |
| Ingress Acceptance | Hybrid ports allow for changing the type of frames that are accepted on ingress. <ul style="list-style-type: none"> <li>• <b>Tagged and Untagged-</b> Both tagged and untagged frames are accepted.</li> <li>• <b>Tagged Only-</b> Only tagged frames are accepted on ingress. Untagged frames are discarded.</li> <li>• <b>Untagged Only-</b> Only untagged frames are accepted on ingress. Tagged frames are discarded.</li> </ul>                                                                                                                                |
| Egress Tagging     | Ports in Trunk and Hybrid mode may control the tagging of frames on egress. <ul style="list-style-type: none"> <li>• <b>Untag Port VLAN-</b> Frames classified to the Port VLAN are transmitted untagged. Other frames are transmitted with the relevant tag.</li> <li>• <b>Tag All-</b> All frames, whether classified to the Port VLAN or not, are transmitted with a tag.</li> <li>• <b>Untag All-</b> All frames, whether classified to the Port VLAN or not, are transmitted without a tag. This option is only available for ports in Hybrid mode.</li> </ul> |
| Allowed VLANs      | Ports in Trunk and Hybrid mode may control which VLANs they are allowed to become members of. Access ports can only be member of one VLAN, the Access VLAN.<br><br>The field's syntax is identical to the syntax used in the Enabled VLANs field. By default, a Trunk or Hybrid port will become member of all VLANs and is therefore set to <b>1-4095</b> .<br><br>The field may be left empty, which means that the port will not become member of any VLANs.                                                                                                     |
| Forbidden VLANs    | A port may be configured to never be member of one or more VLANs. This is particularly useful when dynamic VLAN protocols like MVRP and GVRP must be prevented from dynamically adding ports to VLANs.<br><br>The trick is to mark such VLANs as forbidden on the port in question. The syntax is identical to the syntax used in the Enabled VLANs field.<br><br>By default, the field is left blank, which means that the port may become a member of all possible VLANs.                                                                                         |

#### 4.6.1.2 VLAN Membership Status and VLAN Name configuration for Combined users

This section provides an overview of membership status of VLAN users and configure VLAN name.

### VLAN User

Various internal software modules may use VLAN services to configure VLAN memberships on the fly. The drop-down list on the right allows for selecting between showing VLAN memberships as configured by an administrator (Admin) or as configured by one of these internal software modules. The "Combined" entry will show a combination of the administrator and internal software modules configuration, and basically reflects what is configured in hardware.

### Navigating the VLAN Membership Status page

Each page shows up to 99 entries from the VLAN table, default being 20, selected through the "entries per page" input field.

When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. Clicking the **Refresh** button will update the displayed table starting from that or the closest next VLAN Table match.

The >> will use the last entry of the currently displayed VLAN entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID      | VLAN ID for which the Port members are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| VLAN Name    | VLAN Name for which the Port members are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Port Members | <p>A row of check boxes for each port is displayed for each VLAN ID. If a port is included in a VLAN, the following image  will be displayed. If a port is in the forbidden port list, an image  will be displayed.</p> <p>If a port is in the forbidden port list and at the same time attempted included in the VLAN, the following image will be displayed: . The port will not be a member of the VLAN in this case.</p> |
| Buttons      | Select function associated VLAN from this drop-down list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### 4.6.1.3 VLAN Port Status for Combined users

This section provides VLAN Port Status.

#### VLAN USER

Various internal software modules may use VLAN services to configure VLAN port configuration on the fly.

The drop-down list on the right allows for selecting between showing VLAN memberships as configured by an administrator (Admin) or as configured by one of these internal software modules.

The “Combined” entry will show a combination of the administrator and internal software modules configuration, and basically reflects what is configured in hardware. If a given software modules hasn’t overridden any of the port settings, the text “No data exists for the selected user” is shown in the table.

**Web GUI: Monitor > VLANs > Ports**

#### VLAN Port Status for Combined users

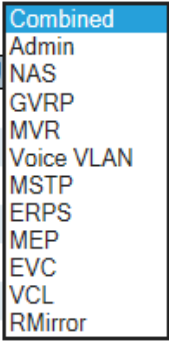

| Port | Port Type | Ingress Filtering                   | Frame Type | Port VLAN ID | Tx Tag     | Untagged VLAN ID | Conflicts |
|------|-----------|-------------------------------------|------------|--------------|------------|------------------|-----------|
| 1    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 2    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 3    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 4    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 5    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 6    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 7    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 8    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag All  |                  | No        |
| 9    | C-Port    | <input checked="" type="checkbox"/> | All        | 1            | Untag PVID |                  | No        |

Combined  Auto-refresh

**Figure 4-28: VLAN Port Status for Combined Users**

**Table 4-25: VLAN Port Status for Combined Users Parameters**

|                   |                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port              | The logical port for the settings contained in the same row.                                                                                                                               |
| Port Type         | Shows the port type (Unaware, C-Port, S-Port, S-Custom-Port.) that a given user wants to configure on the port. The field is empty if not overridden by the selected user.                 |
| Ingress Filtering | Shows whether a given user wants ingress filtering enabled or not. The field is empty if not overridden by the selected user.                                                              |
| Frame Type        | Shows the acceptable frame types (All, Tagged, Untagged) that a given user wants to configure on the port. The field is empty if not overridden by the selected user.                      |
| Port VLAN ID      | Shows the Port VLAN ID (PVID) that a given user wants the port to have. The field is empty if not overridden by the selected user.                                                         |
| Tx Tag            | Shows the Tx Tag requirements (Tag All, Tag PVID, Tag UVID, Untag All, Untag PVID, Untag UVID) that a given user has on a port. The field is empty if not overridden by the selected user. |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Untagged VLAN ID | If Tx Tag is overridden by the selected user and is set to Tag or Untag UVID, then this field will show the VLAN ID the user wants to tag or untag on egress. The field is empty if not overridden by the selected user.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Conflicts        | <p>Two users may have conflicting requirements to a port's configuration. For instance, one user may require all frames to be tagged on egress while another requires all frames to be untagged on egress. Since both users cannot win, this gives rise to a conflict, which is solved in a prioritized way. The Administrator has the least priority. Other software modules are prioritized according to their position in the drop-down list: The higher in the list, the higher priority. If conflicts exist, it will be displayed as "Yes" for the "Combined" user and the offending software module.</p> <p>The "Combined" user reflects what is configured in hardware.</p> |
| Buttons          | <p>Select function associated VLAN from this drop-down list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 4.6.2 VLAN Membership Status for Combined users

This section provides an overview of membership status of VLAN users.

#### VLAN User

Various internal software modules may use VLAN services to configure VLAN memberships on the fly. The drop-down list on the right allows for selecting between showing VLAN memberships as configured by an administrator (Admin) or as configured by one of these internal software modules.

The "Combined" entry will show a combination of the administrator and internal software modules configuration, and basically reflects what is configured in hardware.

#### Navigating the VLAN Membership Status page

Each page shows up to 99 entries from the VLAN table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. Clicking the **Refresh** button will update the displayed table starting from that or the closest next VLAN Table match.

The >> will use the last entry of the currently displayed VLAN entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

**Web GUI: Monitor > VLANs > Membership**

**Figure 4-29: VLAN Membership Status for Combined Users**

**Table 4-26: VLAN Membership Status for Combined users Parameters**

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID      | VLAN ID for which the Port members are displayed.                                                                                                                                                                                                                                                                                                                                                                                      |
| VLAN Name    | VLAN Name for which the Port members are displayed.                                                                                                                                                                                                                                                                                                                                                                                    |
| Port Members | <p>A row of check boxes for each port is displayed for each VLAN ID. If a port is included in a VLAN, the following image ✓ will be displayed.</p> <p>If a port is in the forbidden port list, an image ✗ will be displayed.</p> <p>If a port is in the forbidden port list and at the same time attempted included in the VLAN, the following image will be displayed: ✗. The port will not be a member of the VLAN in this case.</p> |
| Buttons      | <p>Combined : Select VLAN Users from this dropdown list</p> <ul style="list-style-type: none"> <li>Combined</li> <li>Admin</li> <li>NAS</li> <li>GVRP</li> <li>MVR</li> <li>Voice VLAN</li> <li>MSTP</li> <li>ERPS</li> <li>MEP</li> <li>EVC</li> <li>VCL</li> <li>RMirror</li> </ul>                                                                                                                                                  |

### 4.6.3 VLAN Translation

VLAN Translation allows the user to swap existing VID on the port ingress to a different VID. The translation is done per group of ports. By default, each port is assigned as an independent group.

#### 4.6.3.1 VLAN Translation Port Configuration

This section allows you to configure switch Ports to use a given VLAN Translation Mapping Group. This will enable all VLAN Translation mappings of that group (if any) on the selected switch port.

**Web GUI: Configuration > VLAN Translation > Port to Group Configuration**

**VLAN Translation Port Configuration**

| Port | Group Configuration      |          |
|------|--------------------------|----------|
|      | Default                  | Group ID |
| *    | <input type="checkbox"/> | <> v     |
| 1    | <input type="checkbox"/> | 1 v      |
| 2    | <input type="checkbox"/> | 2 v      |
| 3    | <input type="checkbox"/> | 3 v      |
| 4    | <input type="checkbox"/> | 4 v      |
| 5    | <input type="checkbox"/> | 5 v      |
| 6    | <input type="checkbox"/> | 6 v      |
| 7    | <input type="checkbox"/> | 7 v      |
| 8    | <input type="checkbox"/> | 8 v      |
| 9    | <input type="checkbox"/> | 9 v      |
| 10   | <input type="checkbox"/> | 10 v     |
| 11   | <input type="checkbox"/> | 11 v     |
| 12   | <input type="checkbox"/> | 12 v     |
| 13   | <input type="checkbox"/> | 13 v     |
| 14   | <input type="checkbox"/> | 14 v     |
| 15   | <input type="checkbox"/> | 15 v     |
| 16   | <input type="checkbox"/> | 16 v     |
| 17   | <input type="checkbox"/> | 17 v     |
| 18   | <input type="checkbox"/> | 18 v     |
| 19   | <input type="checkbox"/> | 19 v     |
| 20   | <input type="checkbox"/> | 20 v     |
| 21   | <input type="checkbox"/> | 21 v     |

Apply Reset

**Figure 4-30: VLAN Translation Port Configuration**

| Port     | The Port column shows the list of ports for which you can configure the VLAN Translation Mapping Group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Default  | To set the switch port to use the default VLAN Translation Group click the checkbox and press Save.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Group ID | <p>The VLAN Translation mappings are organized into Groups, identified by the Group ID. This way a port is configured to use several VLAN Translation mappings easily by simply configuring it to use a given group. Then the number of possible groups in a switch is equal to the number of ports present in this switch. A port can be configured to use any of the groups, but only one at any given time. Multiple ports can be configured to use the same group. A valid Group ID is an integer value from 1 to 21.</p> <hr/> <p><i>Note: By default, each port is set to use the group with Group ID equal to the port number. For example, port #1 is by default set to use group with GID = 1.</i></p> <hr/> <p>For example, port #1 is by default set to use group with GID = 1.</p> |

### 4.6.3.2 VLAN Translation Mapping Table

This section allows you to create mappings of VLANs -> Translated VLANs and organize these mappings into global Groups.

**Web GUI: Configuration > VLAN Translation > VLAN Translation Mapping**

#### Mapping Configuration

##### Mapping Parameters

|          |        |
|----------|--------|
| Group ID | 0      |
| DIR      | Both ▼ |
| VID      | 0      |
| TVID     | 0      |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group ID  | <p>The VLAN Translation mappings are organized into Groups, identified by the Group ID.</p> <p>This way a port is configured to use several VLAN Translation mappings easily by simply configuring it to use a given group. Then number of possible groups in a switch is equal to the number of ports present in this switch. A port can be configured to use any of the groups, but only one at any given time. Multiple ports can be configured to use the same group. A valid Group ID is an integer value from 1 to 10.</p> <hr/> <p><i><b>Note:</b> By default, each port is set to use the group with Group ID equal to the port number. For example, port #1 is by default set to use group with GID = 1.</i></p> <hr/> |
| Direction | <p>Indicates the direction of the VLAN Translation and it refers to the switch. The direction can be 'Ingress', where the translation takes place on the VLAN ID of frames entering the switch port, 'Egress', where the translation takes place on the VLAN ID of frames exiting the switch port, or 'Both', where the translation takes place on both above directions.</p>                                                                                                                                                                                                                                                                                                                                                   |
| VID       | <p>Indicates the ID to which Group ID will be mapped. A valid VLAN ID ranges from 1-4095.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TVID      | <p>Indicates the VLAN ID to which VLAN ID of an ingress frame will be translated to (granted that the mapping is enabled on the ingress port that the frame arrived at). A valid VLAN ID ranges from 1 to 4095.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Buttons   | <p><b>Remove All:</b> Click to remove all VLAN Translation mappings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modification Buttons | <p>You can modify each VLAN Translation mapping in the table using the following buttons:</p> <p>: Edits the mapping row.</p> <p>: Deletes the mapping.</p> <p>: Adds a new mapping.</p> |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### 4.6.4 Provider Bridges (QinQ)

The use of an extra VLAN header (service provider tag) as part of the Ethernet frame header to provide differentiation between traffic flows (whether a separate service, or a separate customer) is common in service provider networks. It extends the notion of bridging from that of bridging between LAN segments or virtual LANs (defined by traditional VLAN tags), to bridging between customers or services.

Providers can use the service provider VLAN tag to identify Ethernet traffic that belongs to a specific Service, and give it the correct treatment (e.g., if the service is more important or time sensitive than others it can get the right QoS handling).

Falcon RX is designed to serve as an NTU for Metro-Ethernet access applications. Such applications use the Provider Bridges (802.1ad) standard to enable Ethernet services implementation.

The Provider Edge Bridge inserts a Service Tag (S-Tag) on all frames received from the Customer network.

This enables implementation of transparent L2 service for high numbers of customers.

Determination of which service to assign a frame to can be based on:

- **Ingress port** – All frames received on a specific ingress port will be assigned to a single service (encapsulated with the same **S-Tag**). Such functionality when used for point-to-point service is defined as EPL (Ethernet Private Line) in MEF specs.
- **Ingress port + C-Tag** – A frame received on a specific ingress port will be assigned to a service based on the port and a table that maps the VLAN tag, on the incoming frame (C-Tag) to the service tag (S-Tag). Such functionality, when used for point-to-point service, is defined as EVPL (Ethernet Virtual Private Line) in MEF specs.

#### 4.6.5 Private VLANs (PVLANS)

Private VLAN is not actually a VLAN (as per IEEE802.1q) feature, but are based on the source port mask, which facilitates switch port segmentation. It segregates a selected groups of ports from other ports on the switch that are not part of the Private VLAN group.

##### 4.6.5.1 Private VLAN Membership Configuration

The Private VLAN membership configurations for the switch can be monitored and modified here. Private VLANs can be added or deleted. Port members of each Private VLAN can be added or removed.

Private VLANs are based on the source port mask, and there are no connections to VLANs. This means that VLAN IDs and Private VLAN IDs can be identical.

A port must be a member of both a VLAN and a Private VLAN to be able to forward packets. By default, **all ports are VLAN unaware and members of VLAN 1 and Private VLAN 1**. A VLAN unaware port can only be a member of one VLAN, but it can be a member of multiple Private VLANs.

**Web GUI: Configuration > Private VLANs > Membership**

**Private VLAN Membership Configuration** Auto-refresh

|                          | PVLAN ID | Port Members                        |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |

| Delete                 | To delete a private VLAN entry, check this box. The entry will be deleted during the next Save.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Private VLAN ID        | Indicates the ID of this private VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Port Members           | <p>A row of check boxes for each port is displayed for each private VLAN ID.</p> <p>To include a port in a private VLAN, check the box.</p> <p>To remove or exclude the port from the private VLAN, make sure the box is unchecked.</p> <p>By default, no ports are members, and all boxes are unchecked.</p>                                                                                                                                                                                                                           |
| Add a New Private VLAN | Click to add a new private VLAN ID. An empty row is added to the table, and the private VLAN can be configured as needed. The allowed range for a private VLAN ID is the same as the switch port number range. Any values outside this range are not accepted, and a warning message appears. Click "OK" to discard the incorrect entry or click "Cancel" to return to the editing and make a correction. The Private VLAN is enabled when you click "Save". The "Delete" button can be used to undo the addition of new Private VLANs. |

#### 4.6.5.2 Port Isolation Configuration

This section is used for enabling or disabling port isolation for ports in a Private VLAN.

A port member of a VLAN can be isolated to other isolated ports on the same VLAN and Private VLAN.

**Web GUI: Configuration > Private VLANs > Port Isolation**

**Port Isolation Configuration** Auto-refresh

| Port Number              |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |

**Figure 4-33: Private VLAN Port Isolation Configuration**

**Table 4-30: Private VLAN Port Isolation Configuration Parameters**

|              |                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Members | A check box is provided for each port of a private VLAN. When checked, port isolation is enabled for that port. When unchecked, port isolation is disabled for that port. By default, port isolation is disabled for all ports. |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.6.6 VCL

This section includes the following subjects:

MAC-based VLAN Membership Configuration. Protocol to Group Mapping Table. Group Name to VLAN mapping Table IP Subnet-based VLAN Membership Configuration.

#### 4.6.6.1 MAC-based VLAN Membership Configuration

This section allows adding and deleting MAC-based VLAN Classification List entries and assigning the entries to different ports.

**Web GUI: Configuration > VCL > MAC-based VLAN**

##### MAC-based VLAN Membership Configuration

|        |                   |         | Port Members             |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |

**Figure 4-34: MAC based VLAN Membership Configuration display**

**Table 4-31: MAC based VLAN Membership Configuration parameters**

|              |                                                                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete       | To delete a MAC to VLAN ID mapping entry, check this box and press save. The entry will be deleted in the stack.                                                                                                                                                                       |
| MAC Address  | Indicates the MAC address of the mapping.                                                                                                                                                                                                                                              |
| VLAN ID      | Indicates the VLAN ID the above MAC will be mapped to.                                                                                                                                                                                                                                 |
| Port Members | A row of check boxes for each port is displayed for each MAC to VLAN ID mapping entry. To include a port in the mapping, check the box. To remove or exclude the port from the mapping, make sure the box is unchecked. By default, no ports are members, and all boxes are unchecked. |

##### Adding a New MAC to VLAN ID mapping entry

Click **Add New Entry** to add a new MAC to VLAN ID mapping entry. An empty row is added to the table, and the mapping can be configured as needed. Any unicast MAC address can be used to configure the mapping. No broadcast or multicast MAC addresses are allowed. Legal values for a VLAN ID are **1** through **4095**. The MAC to VLAN ID entry is enabled when you click **Save**. A mapping without any port members will not be added when you click **Save**. The **Delete** button can be used to undo the addition of new mappings. The maximum possible MAC to VLAN ID mapping entries is limited to 256.

### 4.6.6.2 Protocol based VLAN

This section allows you to add a new Protocol to a Group Name (each protocol can be part of only one Group) mapping entries as well as allow you to see and delete already mapped entries for the There are two subjects:

- Protocol to Group Mapping Table.
- Group Name to VLAN mapping Table **Web GUI: Configuration > VCL > Protocol-based VLAN > Protocol to Group**

**Protocol to Group Mapping Table** Auto-refresh

| Delete                                | Frame Type | Value         | Group Name           |
|---------------------------------------|------------|---------------|----------------------|
| <input type="button" value="Delete"/> | Ethernet ▼ | Etype: 0x0800 | <input type="text"/> |

**Figure 4-35: Protocol to Group Mapping Table display**

**Table 4-32: Protocol to Group Mapping Table parameters**

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Delete       | To delete a Group Name to VLAN mapping, check this box. The entry will be deleted from the switch during the next Save.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Group Name   | <p>A valid Group Name is a string, at the most 16 characters long, which consists of a combination of alphabets (a-z or A-Z) and integers (0-9) with no special characters allowed.</p> <p>You may either use a Group that already includes one or more protocols (see Protocol to Group mappings) or create a Group to VLAN ID mapping that will become active the moment you add one or more protocols inside that Group.</p> <p>Furthermore, the Group to VLAN ID mapping is not unique, as long as the port lists of these mappings are mutually exclusive (e.g., Group1 can be mapped to VID 1 on port#1 and to VID 2 on port#2).</p> |
| VLAN ID      | Indicates the VLAN ID to which the Group Name will be mapped. A valid VLAN ID ranges from 1 to 4095                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Port Members | A row of check boxes for each port is displayed for each Group Name to VLAN ID mapping. To include a port in the mapping, check the box. To remove or exclude the port from the mapping, make sure the box is unchecked. By default, no ports are members, and all boxes are unchecked.                                                                                                                                                                                                                                                                                                                                                    |

**Adding a New Group to VLAN mapping entry**

Click **Add New Entry** to add a new entry in the mapping table. An empty row is added to the table and the Group Name, VLAN ID and port members can be configured as needed. Legal values for a VLAN ID are **1** through **4095**.

The **Delete** button can be used to undo the addition of new entry. The maximum possible Group to VLAN mappings is limited to 256.

#### 4.6.6.4 IP Subnet based VLAN Membership Configuration

The IP subnet to VLAN ID mappings can be configured here. This section allows adding, updating, and deleting IP subnet to VLAN ID mapping entries and assigning them to different ports.

**Web GUI: Configuration > VCL > IP Subnet-based VLAN**

**IP Subnet-based VLAN Membership Configuration** Auto-refresh

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | To delete a mapping, check this box and press save. The entry will be deleted in the stack.                                                                                                                                                                                                      |
| IP Address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Indicates the subnet's IP address (Any of the subnet's host addresses can be also provided here, the application will convert it automatically).                                                                                                                                                 |
| Mask Length                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Indicates the subnet's mask length.                                                                                                                                                                                                                                                              |
| VLAN ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Indicates the VLAN ID the subnet will be mapped to. IP Subnet to VLAN ID is a unique matching.                                                                                                                                                                                                   |
| Port Members                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | A row of check boxes for each port is displayed for each IP subnet to VLAN ID mapping entry. To include a port in a mapping, simply check the box. To remove or exclude the port from the mapping, make sure the box is unchecked. By default, no ports are members, and all boxes are unchecked |
| <p>Adding a New IP subnet based VLAN</p> <p>Click <b>Add New Entry</b>: to add a new IP subnet to VLAN ID mapping entry. An empty row is added to the table, and the mapping can be configured as needed. Any IP address/mask can be configured for the mapping. Legal values for the VLAN ID are <b>1</b> to <b>4095</b>. The IP subnet to VLAN ID mapping entry is enabled when you click on <b>Save</b>.</p> <p>The <b>Delete</b> button can be used to undo the addition of new mappings The maximum possible IP subnet to VLAN ID mappings are limited 128</p> |                                                                                                                                                                                                                                                                                                  |

### 4.6.7 Voice VLAN

The Voice VLAN feature enables voice traffic forwarding on the Voice VLAN, then the switch can classify and schedule network traffic. It is recommended that there be two VLANs on a port - one for voice, one for data. Before connecting the IP device to the switch, the IP phone should configure the voice VLAN ID correctly. It should be configured through its own GUI.

#### 4.6.7.1 Voice VLAN Configuration

**Web GUI: Configuration > Voice VLAN > Configuration**

#### Voice VLAN Configuration

|               |          |         |
|---------------|----------|---------|
| Mode          | Disabled | ▼       |
| VLAN ID       | 1000     |         |
| Aging Time    | 86400    | seconds |
| Traffic Class | 7 (High) | ▼       |

**Figure 4-38: Voice VLAN Configuration display.**

**Table 4-35: Voice VLAN Configuration parameters.**

| Voice VLAN Configuration |                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                     | Indicates the Voice VLAN mode operation. We must disable MSTP feature before we enable Voice VLAN. It can avoid the conflict of ingress filtering. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Enable Voice VLAN mode operation.</li> <li>• <b>Disabled:</b> Disable Voice VLAN mode operation.</li> </ul> |
| VLAN ID                  | Indicates the Voice VLAN ID. It should be a unique VLAN ID in the system and cannot equal each port PVID. It is a conflict in configuration if the value equals management VID, MVR VID, PVID etc. The allowed range is <b>1 to 4095</b> .                                                                                                  |
| Aging Time               | Indicates the Voice VLAN secure learning aging time. The allowed range is <b>10 to 10000000</b> seconds. It is used when security mode or auto detect mode is enabled. In other cases, it will be based on hardware aging time. The actual aging time will be situated between the [age time; 2 * age time] interval.                       |
| Traffic Class            | Indicates the Voice VLAN traffic class. All traffic on the Voice VLAN will apply this class.                                                                                                                                                                                                                                                |

### 4.6.7.2 Port Configuration

Web GUI: Configuration > Voice VLAN > Configuration

#### Port Configuration

| Port Configuration |                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port               | The logical port for the settings contained in the same row.                                                                                                                                                                                                                                                                                                                         |
| Mode               | Indicates the Voice VLAN port mode. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Disabled:</b> Disjoin from Voice VLAN.</li> <li>• <b>Auto:</b> Enable auto detect mode. It detects whether there is VoIP phone attached to the specific port and configures the Voice VLAN members automatically.</li> <li>• <b>Forced:</b> Force join to Voice VLAN.</li> </ul> |

| Port Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security           | <p>Indicates the Voice VLAN port security mode. When the function is enabled, all non-telephonic MAC addresses in the Voice VLAN will be blocked for 10 seconds. Possible port modes are:</p> <p><b>Enabled:</b> Enable Voice VLAN security mode operation.</p> <p><b>Disabled:</b> Disable Voice VLAN security mode operation.</p>                                                                                                                                                                                                      |
| Discovery Protocol | <p>Indicates the Voice VLAN port discovery protocol. It will only work when auto detect mode is enabled. We should enable LLDP feature before configuring discovery protocol to "LLDP" or "Both". Changing the discovery protocol to "OUI" or "LLDP" will restart auto detect process. Possible discovery protocols are:</p> <ul style="list-style-type: none"> <li>• <b>OUI:</b> Detect telephony device by OUI address.</li> <li>• <b>LLDP:</b> Detect telephony device by LLDP.</li> <li>• <b>Both:</b> Both OUI and LLDP.</li> </ul> |

### 4.6.7.3 Voice VLAN OUI Table

Configure VOICE VLAN OUI table on this page. The maximum number of entries is **16**. Modifying the OUI table will restart auto detection of OUI process

OUI is the organizationally unique identifier. An OUI address is a globally unique identifier assigned to a vendor by IEEE. You can determine which vendor a device belongs to according to the OUI address which forms the first 24 bits of a MAC address.

**Web GUI: Configuration > Voice VLAN > Oui**

#### Voice VLAN OUI Table

| Delete                   | Telephony OUI | Description               |
|--------------------------|---------------|---------------------------|
| <input type="checkbox"/> | 00-01-e3      | Siemens AG phones         |
| <input type="checkbox"/> | 00-03-6b      | Cisco phones              |
| <input type="checkbox"/> | 00-0f-e2      | H3C phones                |
| <input type="checkbox"/> | 00-60-b9      | Philips and NEC AG phones |
| <input type="checkbox"/> | 00-d0-1e      | Pingtel phones            |
| <input type="checkbox"/> | 00-e0-75      | Polycom phones            |
| <input type="checkbox"/> | 00-e0-bb      | 3Com phones               |

**Table 4-37: Voice VLAN OUI Table parameters**

|               |                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete        | Check to delete the entry. It will be deleted during the next save.                                                                                                               |
| Telephony OUI | A telephony OUI address is a globally unique identifier assigned to a vendor by IEEE. It must be 6 characters long and the input format is "xx-xx-xx" (x is a hexadecimal digit). |
| Description   | The description of OUI address. Normally, it describes which vendor telephony device it belongs to. The allowed string length is <b>0</b> to <b>32</b> .                          |
| Buttons       | <b>Add New Entry:</b> Click to add a new access management entry.                                                                                                                 |

## 4.6.8 Multicast VLAN Registration (MVR)

This section provides MVR related configurations. The MVR feature enables multicast traffic forwarding on the Multicast VLANs. In a multicast television application, a PC or a network television or a set-top box can receive the multicast stream. Multiple set-top boxes or PCs can be connected to one subscriber port, which is a switch port configured as an MVR receiver port. When a subscriber selects a channel, the set-top box or PC sends an IGMP/MLD report message to Switch A to join the appropriate multicast group address. Uplink ports that send and receive multicast data to and from the multicast VLAN are called MVR source ports. It is allowed to create at maximum 4 MVR VLANs with corresponding channel profile for each Multicast VLAN. The channel profile is defined by the IPMC Profile, which provides the filtering conditions.

The Querier should connect on the source port. By giving the static membership of MVR VLAN, device only forwards the IGMP reports from downstream(receiver ports) to upstream(source ports) and the Query packet which comes from the downstream will be ignored silently. After the MVR VLAN members are properly configured, it is required to associate an [IPMC profile](#) with the specific MVR VLAN to be the expected channel. The channel profile is defined by the IPMC Profile which provides the filtering conditions. Notice that the profile only works when the global profile mode is enabled. It is allowed to create at maximum 4 MVR VLANs with corresponding channel profile.

**The MVR includes the following subjects:**

- MVR Configuration
- VLAN Interface Setting
- Immediate Leave Setting
- MVR Statistics
- MVR Channels (Groups) Information
- MVR SFM Information

### 4.6.8.1 MVR Configurations

**Web GUI: Configuration > Voice VLAN > Oui**

#### MVR Configurations

|                 |            |
|-----------------|------------|
| <b>MVR Mode</b> | Disabled ▾ |
|-----------------|------------|

**Figure 4-41: MVR Configurations**

**Table 4-38: MVR Configuration parameters**

|          |                                                                                                                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MVR Mode | Enable/Disable the Global MVR. The Unregistered Flooding control depends on the current configuration in IGMP/MLD Snooping. It is suggested to enable Unregistered Flooding control when the MVR group table is full. |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.6.8.2 VLAN Interface Setting

**Web GUI: Configuration > MVR**

**Figure 4-42: VLAN Interface Setting display**

**Table 4-39: VLAN Interface Setting parameters**

| VLAN Interface Setting |                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                 | Check to delete the entry. The designated entry will be deleted during the next save.                                                                                                                                                                                                                                                                                            |
| MVR VID                | Specify the Multicast VLAN ID.<br><b>Be Caution:</b> MVR source ports are not recommended to be overlapped with management VLAN ports.                                                                                                                                                                                                                                           |
| MVR Name               | MVR Name is an optional attribute to indicate the name of the specific MVR VLAN. Maximum length of the MVR VLAN Name string is 16. MVR VLAN Name can only contain alphabets or numbers. When the optional MVR VLAN name is given, it should contain at least one alphabet. MVR VLAN name can be edited for the existing MVR VLAN entries, or it can be added to the new entries. |
| IGMP Address           | Define the IPv4 address as source address used in IP header for IGMP control frames. The default IGMP address is not set (0.0.0.0). When the IGMP address is not set, system uses IPv4 management address of the IP interface associated with this VLAN. When the IPv4 management address is not set, system uses the first available IPv4 management address.                   |
| Mode                   | Specify the MVR mode of operation. In Dynamic mode, MVR allows dynamic MVR membership reports on source ports. In Compatible mode, MVR membership reports are forbidden on source ports. The default is Dynamic mode.                                                                                                                                                            |
| Tagging                | Specify whether the traversed IGMP/MLD control frames will be sent as Untagged or Tagged with MVR VID. The default is Tagged.                                                                                                                                                                                                                                                    |
| Priority               | Specify how the traversed IGMP/MLD control frames will be sent in prioritized manner. The default Priority is 0.                                                                                                                                                                                                                                                                 |
| LLQI                   | Define the maximum time to wait for IGMP/MLD report memberships on a receiver port before removing the port from multicast group                                                                                                                                                                                                                                                 |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | membership. The value is in units of tenths of a second. The range is from 0 to 31744. The default LLQI is 5 tenths or one-half second.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Interface Channel Profile | When the MVR VLAN is created, select the IPMC Profile as the channel filtering condition for the specific MVR VLAN. Summary about the Interface Channel Profiling (of the MVR VLAN) will be shown by clicking the view button. Profile selected for designated interface channel is not allowed to have overlapped permit group address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Profile Management Button | You can inspect the rules of the designated profile by using the following button: Navigate: List the rules associated with the designated profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Port                      | The logical port for the settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Port Role                 | <p>Configure an MVR port of the designated MVR VLAN as one of the following roles.</p> <ul style="list-style-type: none"> <li>• <b>Inactive:</b> The designated port does not participate MVR operations.</li> <li>• <b>Source:</b> Configure uplink ports that receive and send multicast data as source ports. Subscribers cannot be directly connected to source ports.</li> <li>• <b>Receiver:</b> Configure a port as a receiver port if it is a subscriber port and should only receive multicast data. It does not receive data unless it becomes a member of the multicast group by issuing IGMP/MLD messages.</li> <li>• <b>Be Caution:</b> MVR source ports are not recommended to be overlapped with management VLAN ports. Select the port role by clicking the Role symbol to switch the setting. <b>I</b> means Inactive; <b>S</b> means Source; <b>R</b> means Receiver.</li> </ul> <p>The default Role is Inactive.</p> |
| Buttons                   | <b>Add New Click MVR VLAN:</b> Click to add new MVR VLAN. Specify the VID and configure the new entry. Click "Save".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 4-41: MVR Statistics parameters**

| MVR Statistics                |                                                                        |
|-------------------------------|------------------------------------------------------------------------|
| ID VLAN                       | The Multicast VLAN ID.                                                 |
| IGMP/MLD Queries Received     | The number of Received Queries for IGMP and MLD, respectively.         |
| IGMP/MLD Queries Transmitted  | The number of Transmitted Queries for IGMP and MLD, respectively.      |
| IGMPv1 Joins Received         | The number of Received IGMPv1 Join's.                                  |
| IGMPv2/MLDv1 Reports Received | The number of Received IGMPv2 Join's and MLDv1 Report's, respectively. |
| IGMPv3/MLDv2 Reports Received | The number of Received IGMPv1 Join's and MLDv2 Report's, respectively. |
| IGMPv2/MLDv1 Leaves Received  | The number of Received IGMPv2 Leave's and MLDv1 Done's, respectively.  |

#### 4.6.8.5 MVR Channels (Groups) Information

Entries in the MVR Channels (Groups) Information Table are shown on this section.

The MVR Channels (Groups) Information Table is sorted first by VLAN ID, and then by group.

**Web GUI: Monitor > MVR > Statistics**

##### MVR Channels (Groups) Information

Auto-refresh  Refresh << >>

| VLAN ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | VLAN ID of the group                  |
| Group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Group address of the group displayed. |
| Port Members                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Ports under this group.               |
| <p>Navigating the MVR Channels (Groups) Information Table</p> <p>Each page shows up to 99 entries from the MVR Group table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MVR Channels (Groups) Information Table.</p> <p>The "Start from <a href="#">VLAN</a>", and "Group Address" input fields allow the user to select the starting point in the MVR Channels (Groups) Information Table. Clicking the <b>Refresh</b> button will update the displayed table starting from that or the closest next MVR Channels (Groups) Information Table match. In addition, the two input fields will - upon a <b>Refresh</b> button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.</p> <p>The &gt;&gt; will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table.</p> <p>Use the &lt;&lt; button to start over.</p> |                                       |

#### 4.6.8.6 MVR SFM Information

**Web GUI: Monitor > MVR > MVR SFM Information**

##### MVR SFM Information

Start from VLAN  and Group Address  with  entries per page.

| VLAN ID         | Group | Port | Mode | Source Address | Type | Hardware Filter/Switch |
|-----------------|-------|------|------|----------------|------|------------------------|
| No more entries |       |      |      |                |      |                        |

Auto-refresh

**Figure 4-46: MVR SFM Information display**

**Table 4-43: MVR SFM Information parameters**

| MVR SFM) Information Table |                                                                                                                                                                                                               |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID VLAN                    | VLAN ID of the group.                                                                                                                                                                                         |
| Group                      | Group address of the group displayed.                                                                                                                                                                         |
| Port                       | Switch port number.                                                                                                                                                                                           |
| Mode                       | Indicates the filtering mode maintained per (VLAN ID, port number, Group Address) basis. It can be either <b>Include</b> or <b>Exclude</b> .                                                                  |
| Source Address             | IP Address of the source. Currently, the maximum number of IP source address for filtering (per group) is 8. When there is no source filtering address, the text "None" is shown in the Source Address field. |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                            |

| Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Indicates the Type. It can be either <b>Allow</b> or <b>Deny</b> .                                                                         |
| Hardware Filter/Switch                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Indicates whether data plane destined to the specific group address from the source IPv4/IPv6 address could be handled by the chip or not. |
| <p>Navigating the MVR SFM Information Table</p> <p>Each page shows up to 99 entries from the MVR SFM Information table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MVR SFM Information table. Clicking the <b>Refresh</b> button will update the displayed table starting from that or the closest next MVR SFM Information Table match. In addition, the two input fields will - upon a <b>Refresh</b> button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address. The &gt;&gt; will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the &lt;&lt; button to start over.</p> |                                                                                                                                            |

## 4.7 Quality of Service (QoS)

QoS is an acronym for **Quality of Service**. It is a method to guarantee a bandwidth relationship between individual applications or protocols. A communications network transports a multitude of applications and data, including high-quality video and delay-sensitive data such as real-time voice. Networks must provide secure, predictable, measurable, and sometimes guaranteed services.

Achieving the required QoS becomes the secret to a successful end-to-end business solution. Therefore, QoS is the set of techniques to manage network resources.

R Class series QoS mechanism integrates a set of techniques to determine how frames pass through the switch. The different functions are briefly described below. See also [Frame Processing Overview](#).

- **Scheduling:** this function is performed in the Scheduler block on the egress side. The egress scheduler supports both Strict Priority scheduling and Weighted Fair Queuing (WFQ). Each egress port has 8 queues.
- **Classification:** this function is performed in the Classifier block on the ingress side. The Classifier checks the header of the frames to decide to which Class of Service to assign the frame. The class of service is the queue number to which the frame is sent on egress (see Scheduling above). The classification is based on L2 to L4 frame header fields. This enables dynamic and flexible QoS based handling of the frames.
- **Rate Limiting:** this function enables control of the traffic flow rate, by policing and shaping using the following techniques (See Rate Limiters for more details):

### 4.7.1 QoS Ingress Port Classification

This section allows you to configure the basic [QoS](#) Ingress Classification settings for all switch ports.

**Web GUI: Configuration > QoS > Port Classification**

#### QoS Port Classification

| Port | Ingress |     |     |     |        |            |                          |     | Egress |
|------|---------|-----|-----|-----|--------|------------|--------------------------|-----|--------|
|      | CoS     | DPL | PCP | DEI | CoS ID | Tag Class. | DSCP Based               | Map | Map    |
| *    | <>      | <>  | <>  | <>  | <>     |            | <input type="checkbox"/> |     |        |
| 1    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 2    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 3    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 4    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 5    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 6    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 7    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 8    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 9    | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 10   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 11   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 12   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 13   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 14   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 15   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 16   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 17   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 18   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 19   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 20   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |
| 21   | 0       | 0   | 0   | 0   | 0      | Disabled   | <input type="checkbox"/> |     |        |

Apply Reset

**Figure 4-47: QoS Ingress Port Classification settings**

**Table 4-44: QoS Ingress Port Classification parameters**

| QoS Ingress Port Classification |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| CoS ID                          | <p>Controls the default <a href="#">CoS ID</a> value.</p> <p>Every incoming frame is classified to a CoS ID, which later can be used as basis for rewriting of different parts of the frame.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Tag Class.                      | <p>Shows the classification mode for tagged frames on this port.</p> <p>Disabled: Use default QoS class and DP level for tagged frames.</p> <p>Enabled: Use mapped versions of PCP and DEI for tagged frames. Click on the mode to configure the mode and/or mapping.</p> <p>Note: This setting has no effect if the port is VLAN unaware. Tagged frames received on VLAN unaware ports are always classified to the default CoS and DPL.</p>                                                                                                                                                                                                                       |
| DSCP Based                      | Click to Enable <a href="#">DSCP</a> Based QoS Ingress Port Classification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

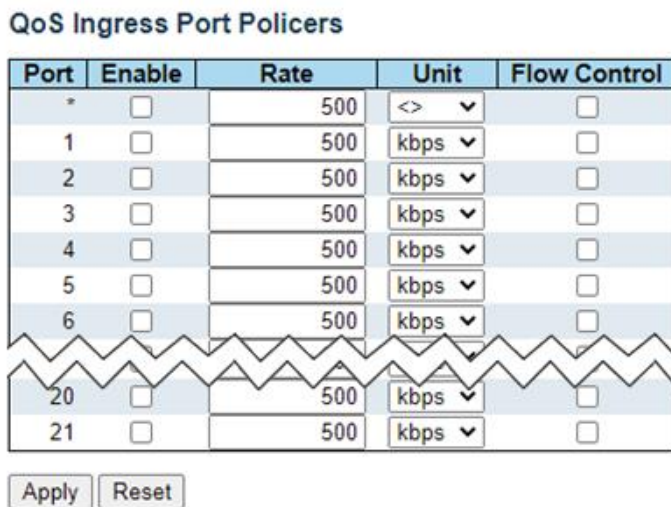

|             |                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ingress Map | Controls the <a href="#">Ingress Map</a> selection through the Map ID. The Ingress Map ID ranges from <b>0</b> to <b>255</b> . An empty field indicates no map selection. |
| Egress Map  | Controls the <a href="#">Egress Map</a> selection through the Map ID. The Egress Map ID ranges from <b>0</b> to <b>511</b> . An empty field indicates no map selection.   |

### 4.7.2 QoS Ingress Port Policers

This section allows you to configure the [Policer](#) settings for all switch ports.

A [policer](#) can limit the bandwidth of received frames. It is in front of the ingress queue.

**Web GUI: Configuration > QoS > Port Policing**

**Figure 4-48: QoS Ingress Port Policers**

**Table 4-45: QoS Ingress Port Policers Parameters**

|              |                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port         | The port number for which the configuration below applies.                                                                                                                                                                                   |
| Enable       | Controls whether the policer is enabled on this switch port.                                                                                                                                                                                 |
| Rate         | Controls the rate for the policer. The default value is 500. This value is restricted to 100-1000000 when the <b>Unit</b> is <b>kbps</b> or <b>fps</b> , and it is restricted to 1-3300 when the <b>Unit</b> is <b>Mbps</b> or <b>KFPS</b> . |
| Unit         | Controls the unit of measure for the policer rate as <b>kbps</b> , <b>Mbps</b> , <b>fps</b> or <b>KFPS</b> . The default value is <b>kbps</b> .                                                                                              |
| Flow Control | If flow control is enabled and the port is in flow control mode, then pause frames are sent instead of discarding frames.                                                                                                                    |

### 4.7.3 QoS Ingress Queue Policers

This section permits to configure the Queue Policer settings for all switch ports. A [Policer](#) can limit the bandwidth of received frames. It is in front of the ingress queue.

**Web GUI: Configuration > QoS > Queue Policing**

#### QoS Ingress Queue Policers

| Port | Queue 0<br>Enable        | Queue 1<br>Enable        | Queue 2<br>Enable        | Queue 3<br>Enable        | Queue 4<br>Enable        | Queue 5<br>Enable        | Queue 6<br>Enable        | Queue 7<br>Enable        |
|------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| *    | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |

**Figure 4-49: QoS Ingress Queue Policers display**

**Table 4-46: QoS Ingress Queue Policers Config parameters**

|        |                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port   | The port number for which the configuration below applies.                                                                                                                                                                                     |
| Enable | Enable or disable the queue policer for this switch port.                                                                                                                                                                                      |
| Rate   | Controls the rate for the queue policer. This value is restricted to 100-3276700 when <b>Unit</b> is kbps, and 1-3276 when <b>Unit</b> is <b>Mbps</b> . The rate is internally rounded up to the nearest value supported by the queue policer. |
| Unit   | Controls the unit of measure for the queue policer rate as kbps, or Mbps. This field is only shown if at least one of the queue policers are enabled.                                                                                          |

### 4.7.4 QoS Egress Port Schedulers

This section provides an overview of QoS Egress Port Schedulers for all switch ports.

**Web GUI: Configuration > QoS > Port Scheduler**

#### QoS Egress Port Schedulers

| Port               | Mode            | Weight |    |    |    |    |    |    |    |
|--------------------|-----------------|--------|----|----|----|----|----|----|----|
|                    |                 | Q0     | Q1 | Q2 | Q3 | Q4 | Q5 | Q6 | Q7 |
| <a href="#">1</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">2</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">3</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">4</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">5</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">6</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">7</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">8</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">9</a>  | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">10</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">11</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">12</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">13</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">14</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">15</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">16</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">17</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">18</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">19</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">20</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |
| <a href="#">21</a> | Strict Priority | -      | -  | -  | -  | -  | -  | -  | -  |

**Figure 4-50: QoS Egress Port Schedulers**

**Table 4-47: QoS Egress Port Schedulers Parameters**

|      |                                                                                                                    |
|------|--------------------------------------------------------------------------------------------------------------------|
| Port | The logical port for the settings contained in the same row. Click on the port number to configure the schedulers. |
| Mode | Shows the scheduling mode for this port.                                                                           |
| Qn   | Shows the weight for this queue and port.                                                                          |

By clicking on any listed port number, you may access to another display where you may configure the QoS Egress Scheduler and Shapers for a specific selected port.

Refer to next page for an illustrated example

Web GUI: Configuration > QoS > Port Scheduler

QoS Egress Port Scheduler and Shapers Port 1

Port 1

Scheduler Mode Strict Priority

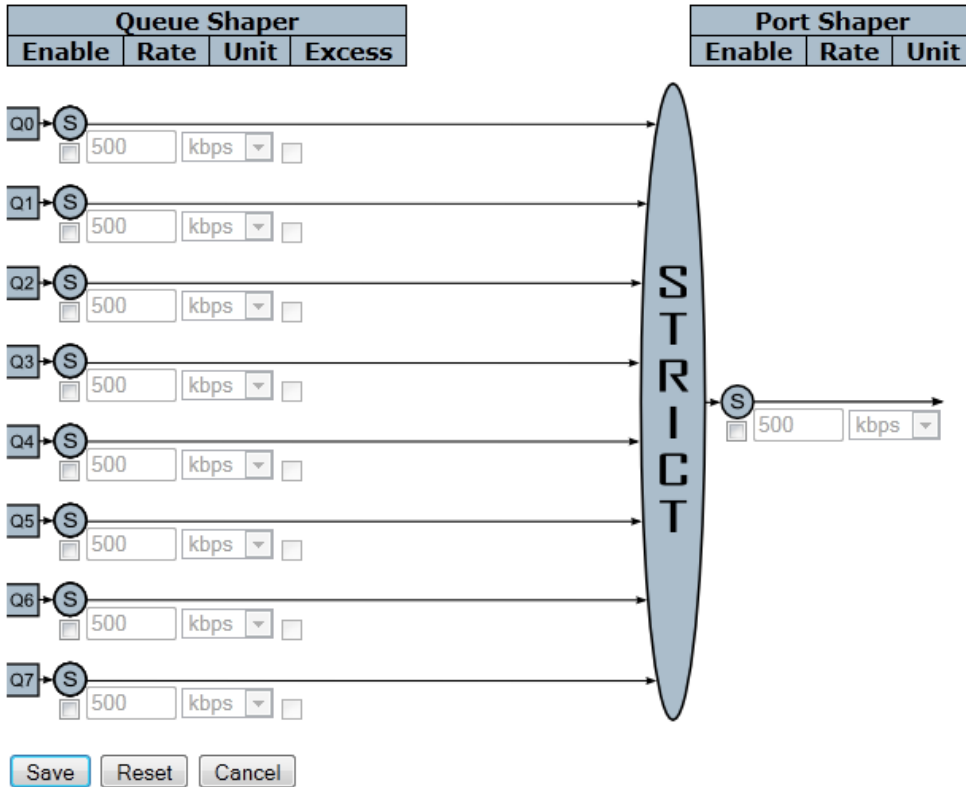

Figure 4-51: QoS Egress Port Schedulers and Shapers

Table 4-48: QoS Egress Port Schedulers and Shapers Parameters

|                             |                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduler Mode              | Controls whether the scheduler mode is <b>Strict Priority</b> or <b>Weighted</b> on this switch port.                                                                                                                                          |
| Queue Shaper Enable         | Controls whether the queue shaper is enabled for this queue on this switch port.                                                                                                                                                               |
| Queue Shaper Rate           | Controls the rate for the queue shaper. The default value is 500. This value is restricted to 100-1000000 when the <b>Unit</b> is <b>kbps</b> , and it is restricted to 1-3300 when the <b>Unit</b> is <b>Mbps</b> .                           |
| Queue Shaper Unit           | Controls the unit of measure for the queue shaper rate as <b>kbps</b> or <b>Mbps</b> . The default value is <b>kbps</b> .                                                                                                                      |
| Queue Shaper Rate-type      | The rate type of the queue shaper. The allowed values are: <ul style="list-style-type: none"> <li><b>Line</b>: Specify that this shaper operates online rate.</li> <li><b>Data</b>: Specify that this shaper operates on data rate.</li> </ul> |
| Queue Scheduler Cut-through | Controls whether the queue has cut-through enabled.                                                                                                                                                                                            |
| Queue Scheduler Preemption  | Controls whether the queue has frame preemption enabled.                                                                                                                                                                                       |

|                         |                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queue Scheduler Weight  | Controls the weight for this queue. The default value is <b>17</b> . This value is restricted to 1-100. This parameter is only shown if <b>Scheduler Mode</b> is set to <b>Weighted</b> .                                                          |
| Queue Scheduler Percent | Shows the weight in percent for this queue. This parameter is only shown if <b>Scheduler Mode</b> is set to <b>Weighted</b> .                                                                                                                      |
| Port Shaper Enable      | Controls whether the port shaper is enabled for this switch port.                                                                                                                                                                                  |
| Port Shaper Rate        | Controls the rate for the port shaper. The default value is 500. This value is restricted to 100-1000000 when the <b>Unit</b> is <b>kbps</b> , and it is restricted to 1-3300 when the <b>Unit</b> is <b>Mbps</b> .                                |
| Port Shaper Unit        | Controls the unit of measure for the port shaper rate as <b>kbps</b> or <b>Mbps</b> . The default value is <b>kbps</b> .                                                                                                                           |
| Port Shaper Rate-type   | The rate type of the port shaper. The allowed values are: <ul style="list-style-type: none"> <li>• <b>Line</b>: Specify that this shaper operates on line rate.</li> <li>• <b>Data</b>: Specify that this shaper operates on data rate.</li> </ul> |

### 4.7.5 QoS Egress Port Shapers

This page provides an overview of QoS Egress Port Shapers for all switch ports.

This section provides an overview of QoS Egress Port Shapers for all switch ports.

**Web GUI: Configuration > QoS > Port Shaping**

#### QoS Egress Port Shapers

| Port | Shapers |    |    |    |    |    |    | Port |    |
|------|---------|----|----|----|----|----|----|------|----|
|      | Q0      | Q1 | Q2 | Q3 | Q4 | Q5 | Q6 |      | Q7 |
| 1    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 2    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 3    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 4    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 5    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 6    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 7    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 8    | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 9    | -       | -  | -  | -  | -  | -  | -  | -    | -  |

| 17   | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 18   | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 19   | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 20   | -       | -  | -  | -  | -  | -  | -  | -    | -  |
| 21   | -       | -  | -  | -  | -  | -  | -  | -    | -  |

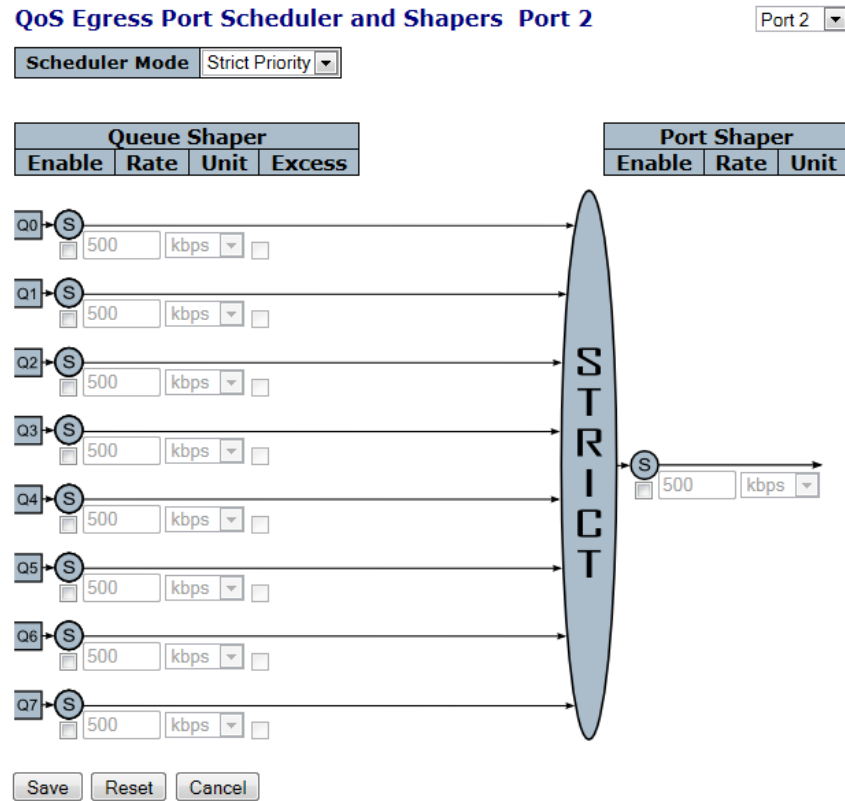

**Figure 4-52: QoS Egress Port Shapers display**

**Table 4-49: QoS Egress Port Shapers parameters**

|      |                                                                                                                          |
|------|--------------------------------------------------------------------------------------------------------------------------|
| Port | The logical port for the settings contained in the same row. Click on the port number in order to configure the shapers. |
| Qn   | Shows "-" for disabled or actual queue shaper rate - e.g., "800 Mbps".                                                   |
| Port | Shows "-" for disabled or actual port shaper rate - e.g., "800 Mbps".                                                    |

By clicking on any port number in the above table, you may access another display, which will allow configuring the QoS Egress Scheduler and Shapers for a specific port.

**Web GUI: Configuration > QoS > Port Shaping**

**Figure 4-53: QoS Egress Port Scheduler and Shapers Configuration**

**Table 4-50: QoS Egress Port Scheduler & Shapers Parameters**

|                             |                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduler Mode              | Controls whether the scheduler mode is <b>Strict Priority</b> or <b>Weighted</b> on this switch port.                                                                                                                                          |
| Queue Shaper Enable         | Controls whether the queue shaper is enabled for this queue on this switch port.                                                                                                                                                               |
| Queue Shaper Rate           | Controls the rate for the queue shaper. The default value is 500. This value is restricted to 100-1000000 when the <b>Unit</b> is <b>kbps</b> , and it is restricted to 1-3300 when the <b>Unit</b> is <b>Mbps</b> .                           |
| Queue Shaper Unit           | Controls the unit of measure for the queue shaper rate as <b>kbps</b> or <b>Mbps</b> . The default value is <b>kbps</b> .                                                                                                                      |
| Queue Shaper Rate-type      | The rate type of the queue shaper. The allowed values are: <ul style="list-style-type: none"> <li><b>Line</b>: Specify that this shaper operates online rate.</li> <li><b>Data</b>: Specify that this shaper operates on data rate.</li> </ul> |
| Queue Scheduler Cut-through | Controls whether the queue has cut-through enabled.                                                                                                                                                                                            |
| Queue Scheduler Preemption  | Controls whether the queue has frame preemption enabled.                                                                                                                                                                                       |

|                         |                                                                                                                                                                                                                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queue Scheduler Weight  | Controls the weight for this queue. The default value is "17". This value is restricted to 1-100. This parameter is only shown if "Scheduler Mode" is set to "Weighted".                                                                           |
| Queue Scheduler Percent | Shows the weight in percent for this queue. This parameter is only shown if "Scheduler Mode" is set to "Weighted".                                                                                                                                 |
| Port Shaper Enable      | Controls whether the port shaper is enabled for this switch port.                                                                                                                                                                                  |
| Port Shaper Rate        | Controls the rate for the port shaper. The default value is 500. This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is restricted to 1-3300 when the "Unit" is "Mbps".                                                      |
| Port Shaper Unit        | Controls the unit of measure for the port shaper rate as "kbps" or "Mbps". The default value is "kbps".                                                                                                                                            |
| Port Shaper Rate-type   | The rate type of the port shaper. The allowed values are: <ul style="list-style-type: none"> <li>• <b>Line:</b> Specify that this shaper operates on line rate.</li> <li>• <b>Data:</b> Specify that this shaper operates on data rate.</li> </ul> |

### 4.7.6 QoS Egress Port Tag Remarking

This section provides an overview of QoS Egress Port Tag Remarking for all switch ports.

**Web GUI: Configuration > QoS > Port Tag Remarking**

#### QoS Egress Port Tag Remarking

| Port | Mode       |
|------|------------|
| 1    | Classified |
| 2    | Classified |
| 3    | Classified |
| 4    | Classified |
| ...  | ...        |
| 19   | Classified |
| 20   | Classified |
| 21   | Classified |

**Figure 4-54: QoS Egress Port Tag Remarking**

By clicking on any port, you may configure the selected port (see example for port 6).

**Table 4-52: QoS Port DSCP Configuration Parameters**

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port             | The Port column shows the list of ports for which you can configure DSCP ingress and egress settings.                                                                                                                                                                                                                                                                                                                                           |
| <b>Ingress</b>   | In Ingress settings you can change ingress translation and classification settings for individual ports. There are two configuration Parameters available in Ingress: <b>Translate</b> and <b>Classify</b> .                                                                                                                                                                                                                                    |
| <b>Translate</b> | To Enable the Ingress Translation, click the checkbox.                                                                                                                                                                                                                                                                                                                                                                                          |
| Classify         | Classification for a port has 4 different values. <ul style="list-style-type: none"> <li>• <b>Disable</b>: No Ingress DSCP Classification.</li> <li>• <b>DSCP=0</b>: Classify if incoming (or translated if enabled) DSCP is 0.</li> <li>• <b>Selected</b>: Classify only selected DSCP for which classification is enabled as specified in DSCP Translation window for the specific DSCP.</li> <li>• <b>All</b>: Classify all DSCP.</li> </ul> |
| Egress           | Port Egress Rewriting can be one of the following: <ul style="list-style-type: none"> <li>• <b>Disable</b>: No Egress rewrite.</li> <li>• <b>Enable</b>: Rewrite enabled without remapping.</li> <li>• <b>Remap</b>: DSCP from analyzer is remapped and frame is remarked with remapped DSCP value.</li> </ul>                                                                                                                                  |

### 4.7.8 DSCP Based QoS Ingress Classification

This section allows you to configure the basic QoS DSCP based QoS Ingress Classification settings for all switches.

**Web GUI: Configuration > QoS > DSCP-Based QoS**

| DSCP      | Trust                    | QoS Class | DPL  |
|-----------|--------------------------|-----------|------|
| *         | <input type="checkbox"/> | <> ▾      | <> ▾ |
| 0 (BE)    | <input type="checkbox"/> | 0 ▾       | 0 ▾  |
| 1         | <input type="checkbox"/> | 0 ▾       | 0 ▾  |
| 2         | <input type="checkbox"/> | 0 ▾       | 0 ▾  |

**Figure 4-57: DSCP Based QoS Ingress Classification**

**Table 4-53: DSCP Based QoS Ingress Classification Parameters**

|           |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DSCP      | <b>DSCP</b> is an acronym for <b>D</b> ifferentiated <b>S</b> ervices <b>C</b> ode <b>P</b> oint. It is a field in the header of IP packets for packet classification purposes. Maximum number of supported DSCP values is 64.                                                                                                                                                                                        |
| Trust     | Controls whether a specific DSCP value is trusted.<br><br>Only frames with trusted DSCP values are mapped to a specific QoS class and Drop Precedence Level.<br>Frames with untrusted DSCP values are treated as a non-IP frame.                                                                                                                                                                                      |
| QoS Class | QoS class value can be any of (0-7)                                                                                                                                                                                                                                                                                                                                                                                   |
| DPL       | Drop Precedence Level (0-1).<br><br>Every incoming frame is classified to a Drop Precedence Level (DP level), which is used throughout the device for providing congestion control guarantee to the frame according to what was configured for that specific DP level.<br><br>A DP level of 0 (zero) corresponds to 'Committed' (Green) frames and a DP level of 1 corresponds to 'Discard Eligible' (Yellow) frames. |

#### 4.7.9 DSCP Translation

This section allows you to configure the basic QoS DSCP Translation settings for all switches. DSCP translation can be performed in Ingress or Egress.

Web GUI: Configuration > QoS > DSCP Translation

DSCP Translation

| DSCP      | Ingress   |                          | Egress    |
|-----------|-----------|--------------------------|-----------|
|           | Translate | Classify                 | Remap     |
| *         | <>        | <input type="checkbox"/> | <>        |
| 0 (BE)    | 0 (BE)    | <input type="checkbox"/> | 0 (BE)    |
| 1         | 1         | <input type="checkbox"/> | 1         |

**Table 4-54: DSCP Translation Parameters**

|         |                                                                                                                                                                                                                                                                                                                                                    |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DSCP    | Maximum number of supported DSCP values is 64. and valid DSCP value ranges from 0 to 63.                                                                                                                                                                                                                                                           |
| Ingress | Ingress side DSCP can be first translated to new DSCP before using the DSCP for QoS class and DPL map.<br><br>There are two configuration Parameters for DSCP Translation.<br><br><b>1. Translate:</b> DSCP at Ingress side can be translated to any of (0-63) DSCP values.<br><b>2. Classify:</b> Click to enable Classification at Ingress side. |
| Egress  | There are the following configurable Parameters for Egress side.<br><br><b>Remap:</b> Select the DSCP value from select menu to which you want to remap. DSCP value ranges from 0 to 63.                                                                                                                                                           |

### 4.7.10 QoS Control List Configuration

This section shows the QoS Control List (QCL), which is made up of the QCEs. Each row describes a QCE that is defined. The maximum number of QCEs is **256** on each switch. Click on the lowest plus sign to add a new QCE to the list.

**Web GUI: Configuration > QoS > DSCP Translation**

#### QCE Configuration

| Port Members                        |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |

**Table 4-55: Quality of Service Control List Configuration Parameters**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QCE                 | Indicates the QCE.id                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Port                | Indicates the list of ports configured with the QCE or <b>Any</b> .                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DMAC                | Specify the type of Destination MAC addresses for incoming frame. Possible values are: <ul style="list-style-type: none"> <li>• <b>Any</b>: All types of Destination MAC addresses are allowed.</li> <li>• <b>Unicast</b>: Only Unicast MAC addresses are allowed.</li> <li>• <b>Multicast</b>: Only Multicast MAC addresses are allowed.</li> <li>• <b>Broadcast</b>: Only Broadcast MAC addresses are allowed.</li> </ul> <p>The default value is <b>Any</b>.</p>                      |
| SMAC                | Match specific source MAC address or <b>Any</b> . If a port is configured to match on destination addresses, this field indicates the DMAC.                                                                                                                                                                                                                                                                                                                                              |
| Tag Type            | Indicates tag type. Possible values are: <ul style="list-style-type: none"> <li>• <b>Any</b>: Match tagged and untagged frames.</li> <li>• <b>Untagged</b>: Match untagged frames.</li> <li>• <b>Tagged</b>: Match tagged frames.</li> </ul> <p>The default value is 'Any'.</p>                                                                                                                                                                                                          |
| VID                 | Indicates (VLAN ID), either a specific VID or range of VIDs. VID can be in the range 1-4095 or 'Any'                                                                                                                                                                                                                                                                                                                                                                                     |
| PCP                 | <b>Priority Code Point</b> : Valid value PCP are specific (0, 1, 2, 3, 4, 5, 6, 7) or range (0-1, 2-3, 4-5, 6-7, 0-3, 4-7) or 'Any'.                                                                                                                                                                                                                                                                                                                                                     |
| DEI                 | <b>Drop Eligible Indicator</b> : Valid value of DEI can be any of values between 0, 1 or <b>Any</b> .                                                                                                                                                                                                                                                                                                                                                                                    |
| Frame Type          | Indicates the type of frame. Possible values are: <p><b>Any</b>: match any frame type.</p> <p><b>Ethernet</b>: Match Ethernet type frames <b>LLC</b>: Only (LLC) frames are allowed.</p> <ul style="list-style-type: none"> <li>• <b>LLC</b>: Match (LLC) frames.</li> <li>• <b>SNAP</b>: MMatch (NAP) frames</li> <li>• <b>IPv4</b>: Match IPV4 frames.</li> <li>• <b>IPv6</b>: Match IPV6 frames.</li> </ul>                                                                           |
| Action              | Indicates the classification action taken on ingress frame if Parameters configured are matched with the frame's content. Possible actions are: <ul style="list-style-type: none"> <li>• <b>CoS</b>: Classify Class of Service</li> <li>• <b>DPL</b>: Classify Drop Precedence Level.</li> <li>• <b>DSCP</b>: Classify DSCP value</li> <li>• <b>PCP</b>: Classify PCP value.</li> <li>• <b>DEI</b>: Classify DEI value.</li> <li>• <b>Policy</b>: Classify ACL Policy number.</li> </ul> |
| Button Modification |  : The lowest plus sign adds a new QCE before the current row.                                                                                                                                                                                                                                                                                                                                        |

### 4.7.11 QCE Configuration

*Note: By clicking on the  sign in the previous QoS Control List Configuration display, we get the below QCE Configuration display, by means of which we can select the required QCE Parameters.*

This section allows to edit/insert a single QoS Control Entry at a time. A QCE consists of several Parameters. These Parameters vary according to the frame type that you select.

**Web GUI: Configuration > QoS > DSCP Translation**

#### QCE Configuration

| Port Members                        |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |                                     |

#### Key Parameters

|            |                                  |
|------------|----------------------------------|
| DMAC       | <input type="text" value="Any"/> |
| SMAC       | <input type="text" value="Any"/> |
| Tag        | <input type="text" value="Any"/> |
| VID        | <input type="text" value="Any"/> |
| PCP        | <input type="text" value="Any"/> |
| DEI        | <input type="text" value="Any"/> |
| Inner Tag  | <input type="text" value="Any"/> |
| Inner VID  | <input type="text" value="Any"/> |
| Inner PCP  | <input type="text" value="Any"/> |
| Inner DEI  | <input type="text" value="Any"/> |
| Frame Type | <input type="text" value="Any"/> |

#### Action Parameters

|                |                                      |
|----------------|--------------------------------------|
| CoS            | <input type="text" value="0"/>       |
| DPL            | <input type="text" value="Default"/> |
| DSCP           | <input type="text" value="Default"/> |
| PCP            | <input type="text" value="Default"/> |
| DEI            | <input type="text" value="Default"/> |
| Policy         | <input type="text"/>                 |
| Ingress Map ID | <input type="text"/>                 |

**Figure 4-60: QCE Parameters displays**

**Table 4-56: QCE Configuration Parameters**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Members   | Check the checkbox button to include the port in the QCL entry. By default, all ports are included.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Key Parameters | Key configuration is described as below: <ul style="list-style-type: none"> <li><b>DMAC:</b> Type Destination MAC type: possible values are unicast (UC), multicast (MC), broadcast (BC) or 'Any'.</li> <li><b>SMAC:</b> Source MAC address: xx-xx-xx (24 MS bits OUI) xx-xx-xx-xx-xx-xx or 'Any'. If a port is configured to match on DMAC/DIP, this field is the Destination MAC address</li> <li><b>Tag:</b> Value of Tag field can be 'Untagged', 'Tagged', 'C-Tagged', 'S-Tagged' or 'Any'.</li> </ul> |

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 4.7.12 Rate Limiters

Rate Limiters control the rate of traffic sent or received on a network interface. Traffic that is less than or equal to the specified rate is forwarded (and may be delayed by a Shaper), whereas traffic that exceeds the rate is dropped or delayed.

**Traffic Policer** monitors network traffic for conformity with a traffic contract and if required, drops (or remarks) traffic to enforce compliance with that contract. Traffic sources which are aware of a traffic contract sometimes apply Traffic Shaping to ensure their output stays within the contract and is thus not dropped. Traffic exceeding a traffic contract may be tagged as non-compliant, dropped, or left as-is depending on configuration and circumstance.

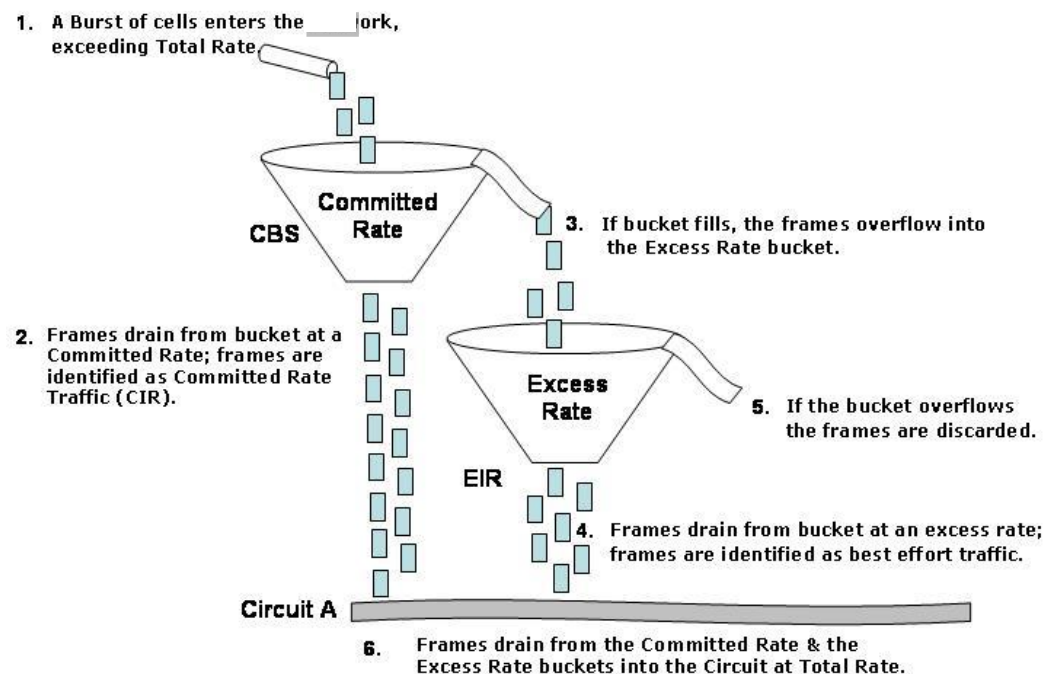

**Traffic Shaper** attempts to control network traffic to optimize or guarantee the bandwidth by delaying packets that exceeds the configured bandwidth profile. Traffic shaping action results in a smooth, evenly distributed flow of frames, complying with the configured rate.

### 4.7.12.1 Leaky Bucket

The leaky-bucket algorithm is used to realize rate limiting (policing or shaping). A leaky bucket provides a mechanism by which bursty traffic can be limited/shaped to present a steady stream of traffic to the network

The dual leaky bucket implementation is named Two-rate Three Color Marker (TrTCM), for which configuration attributes are assigned:

- CIR: Committed Information Rate: the rate in bits-per-second which the Policer is committed to pass through.
- CBS: Committed Burst Size: the burst size in bytes, allowed for the committed bucket.
- EIR: Excess Information Rate: the rate in bits-per-second which the Policer is allowing to pass through when only excess resources are available.
- EBS: Excess Burst Size: the burst size in bytes, allowed for the excess bucket.

**Figure 4-61: Dual Leaky Bucket**

### 4.7.13 Global Storm Policer Configuration

Storm control prevents traffic on a LAN from being overloaded by a broadcast, multicast, or unknown-unicast storm. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configuration, or users issuing a denial-of-service attack can cause a storm.

There is a unicast storm policer, multicast storm policer, and a broadcast storm policer. These only affect flooded frames, i.e., frames with a (VLAN ID, DMAC) pair not present in the MAC Address table.

Web GUI: Configuration > QoS > Storm Policing

Global Storm Policer Configuration

| Frame Type | Enable                   | Rate | Unit                                 |
|------------|--------------------------|------|--------------------------------------|
| Unicast    | <input type="checkbox"/> | 10   | fps <input type="button" value="v"/> |
| Multicast  | <input type="checkbox"/> | 10   | fps <input type="button" value="v"/> |
| Broadcast  | <input type="checkbox"/> | 10   | fps <input type="button" value="v"/> |

Port Storm Policer Configuration

| Port | Unicast Frames           |      |                                       | Broadcast Frames         |      |                                       | Unknown Frames           |      |                                       |

Table 4-57: Global Storm Policer Configuration Parameters

|            |                                                                                                                                                                                                                                                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Frame Type | The frame type for which the configuration below applies.                                                                                                                                                                                                                                                                                              |
| Enable     | Enable or disable the global storm policer for the given frame type.                                                                                                                                                                                                                                                                                   |
| Rate       | Controls the rate for the global storm policer. This value is restricted to 10-13128147 when <b>Unit</b> is <b>fps</b> or <b>kpbs</b> , and 1-13128 when <b>Unit</b> is <b>kfps</b> or <b>Mbps</b> . The rate is internally rounded up to the nearest value supported by the global storm policer. Supported rates are divisible by 10 fps or 25 kpbs. |
| Unit       | Controls the unit of measure for the global storm policer rate as <b>fps</b> , <b>kfps</b> , <b>kpbs</b> or <b>Mbps</b> .                                                                                                                                                                                                                              |

**Table 4-58: Port Storm Policer Configuration Parameters**

|        |                                                                                                                                                                                                                                                                                                                                     |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port   | The port number for which the configuration below applies.                                                                                                                                                                                                                                                                          |
| Enable | Enable or disable the storm policer for this switch port.                                                                                                                                                                                                                                                                           |
| Rate   | Controls the rate for the port storm policer. This value is restricted to 10-13128147 when <b>Unit</b> is fps or kbps, and 1-13128 when <b>Unit</b> is <b>kfps</b> or <b>Mbps</b> . The rate is internally rounded up to the nearest value supported by the port storm policer. Supported rates are divisible by 10 fps or 25 kbps. |
| Unit   | Controls the unit of measure for the port storm policer rate as <b>fps</b> , <b>kfps</b> , <b>kbps</b> or <b>Mbps</b> .                                                                                                                                                                                                             |

## 4.8 Security Features

R Class **series** enables a set of security features. Security is realized by several different mechanisms included in the Switch and Network section.

### 4.8.1 Switch

The Switch section contains the following sub-sections:

- User Configuration
- Privilege Level Configuration
- Authentication Method Configuration
- SSH Configuration
- HTTPS Configurations
- Access Management Configuration
- Access Management Statistics

#### 4.8.1.1 User Configuration

This subsection provides an overview of the current users.

Currently the only way to login as another user on the web server is to close and reopen the browser.

**Web GUI: Configuration > Security > Switch > Users**

#### Users Configuration

| User Name | Privilege Level |
|-----------|-----------------|
| moose     | 15              |
| marcello  | 10              |

|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username        | The name identifying the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Privilege level | The privilege level of the user. The allowed range is 0 to 15. If the privilege level value is 15, it can access all groups, i.e., that is granted the fully control of the device. But others value need to refer to each group privilege level. User's privilege should be same or greater than the group privilege level to have the access of that group. By default setting, most groups privilege level 5 has the read-only access and privilege level 10 has the read-write access. And the system maintenance (software upload, factory defaults etc.) need user privilege level 15. Generally, the privilege level 15 can be used for an administrator account, privilege level 10 for a standard user account and privilege level 5 for a guest account. |
| Buttons         | <b>Add New User:</b> Click to add a new user. The maximum numbers of users is 20.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username        | A string identifying the username that this entry should belong to. The allowed string length is 1 to 31. The valid username allows letters, numbers and underscores.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Password        | The password of the user. The allowed string length is 0 to 31. Any printable characters including Space is accepted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Privilege level | The privilege level of the user. The allowed range is <b>0</b> to <b>15</b> . If the privilege level value is 15, it can access all groups, i.e., that is granted the fully control of the device. But other values must refer to each group privilege level. User's privilege should be same or greater than the group privilege level to have the access of that group. By default setting, most groups privilege level 5 has the read-only access and privilege level 10 has the read-write access. And the system maintenance (software upload, factory defaults etc.) need user privilege level 15. Generally, the privilege level 15 can be used for an administrator account, privilege level 10 for a standard user account and privilege level 5 for a guest account. |

|         |                                                                                                                                                                                     |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <ul style="list-style-type: none"> <li>• <b>Security:</b> Authentication, System Access Management, Port (contains Dot1x port, MAC based and the MAC Address Limit), ACL, HTTPS, SSH, ARP Inspection and IP source guard.</li> <li>• <b>IP:</b> Everything except 'ping'.</li> <li>• <b>Port:</b> Everything except 'VeriPHY'.</li> <li>• <b>Diagnostics:</b> 'ping' and 'VeriPHY'.</li> <li>• <b>Maintenance:</b> CLI- System Reboot, System Restore Default, System Password, Configuration Save, Configuration Load and Firmware Load. Web- Users, Privilege Levels and everything in Maintenance.</li> <li>• <b>Debug:</b> Only present in CLI.</li> </ul> |
| Privilege Levels | The Privilege Levels can be configured between 0 to 15 (where 0 is lowest level and 15 is highest level) Every group has an authorization Privilege level for the following sub-groups: configuration read-only, configuration/execute read-write, status/statistics read-only, status/statistics read-write (e.g., for clearing of statistics). User Privilege should be same or greater than the authorization Privilege level to have the access to that group.                                                                                                                                                                                             |

### 4.8.1.3 Authentication Method Configurations

This subsection allows you to configure how a user is authenticated when he logs into the switch via one of the management client interfaces. The figure has one row for each client type and several columns.

**Web GUI: Configuration > Security > Switch > Auth Method**

#### Authentication Method Configuration

| Client  | Methods |      |      |
|---------|---------|------|------|
| console | local ▼ | no ▼ | no ▼ |
| telnet  | local ▼ | no ▼ | no ▼ |
| ssh     | local ▼ | no ▼ | no ▼ |
| http    | local ▼ | no ▼ | no ▼ |

#### Command Authorization Method Configuration

| Client  | Method | Cmd Lvl | Cfg Cmd                  |
|---------|--------|---------|--------------------------|
| console | no ▼   | 0       | <input type="checkbox"/> |
| telnet  | no ▼   | 0       | <input type="checkbox"/> |
| ssh     | no ▼   | 0       | <input type="checkbox"/> |

#### Accounting Method Configuration

| Client  | Method | Cmd Lvl | Exec                     |
|---------|--------|---------|--------------------------|
| console | no ▼   |         | <input type="checkbox"/> |
| telnet  | no ▼   |         | <input type="checkbox"/> |
| ssh     | no ▼   |         | <input type="checkbox"/> |

| Authentication Methods                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Authentication Method can be set to one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>No</b>: authentication is disabled, and login is not possible.</li> <li>• <b>local</b>: use the local user database on the switch for authentication.</li> <li>• <b>radius</b>: use a remote RADIUS server for authentication.</li> <li>• <b>tacacs+</b>: use a remote TACACS+server for authentication</li> </ul> |
| <p>Methods that involve remote servers are timed out if the remote servers are offline. In this case the next method is tried. Each method is tried from left to right and continues until a method either approves or rejects a user. If a remote server is used for primary authentication it is recommended to configure secondary authentication as 'local'. This will enable the management client to login via the local user database if none of the configured authentication servers are alive.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                        |

#### 4.8.1.4 SSH Configuration

**SSH** is an acronym for **Secure Shell**. It is a network protocol that allows data to be exchanged using a secure channel between two networked devices. The encryption used by SSH provides confidentiality

and integrity of data over an insecure network. The goal of SSH was to replace the earlier rlogin, [TELNET](#) and RSH protocols, which did not provide strong authentication or guarantee confidentiality

### 4.8.1.5 HTTPS Configuration

HTTP is an acronym for **H**ypertext **T**ransfer **P**rotocol. It is a protocol that used to transfer or convey information on the World Wide Web (WWW).

HTTP defines how messages are formatted and transmitted, and what actions Web servers and browsers should take in response to various commands. For example, when you enter a URL in your browser, this sends an HTTP command to the Web server directing to fetch and transmit the requested Web page. The other main standard that controls how the World Wide Web works is HTML, which covers how Web pages are formatted and displayed.

Any Web server machine contains, in addition to the Web page files it can serve, an HTTP daemon, a program that is designed to wait for HTTP requests and handle them when they arrive. The Web browser is an HTTP client, sending requests to server machines. An HTTP client initiates a request by establishing a Transmission Control Protocol (TCP) connection to a particular port on a remote host (port 80 by default). An HTTP server listening on that port waits for the client to send a request message.

**Web GUI: Configuration > Security > Switch > HTTP**

### HTTPS Configuration

It is only significant when "HTTPS Mode Enabled" is selected. When the redirect mode is enabled, the HTTP connection will be redirected to HTTPS connection automatically. Notice that the browser may not allow the redirect operation due to the security consideration unless the switch certificate is trusted to the browser. You need to initialize the HTTPS connection manually for this case. Possible modes are:</p> <p><b>Enabled:</b> Enable HTTPS redirect mode operation.</p> <p><b>Disabled:</b> Disable HTTPS redirect mode operation</p>                                                                                                                                                                                                              |             |                                               |                           |                                               |                             |                                             |                                |                      |                           |                                                  |                    |                                                           |                           |                                             |

|                    | For example, tftp://10.10.10.10/new_image_path/new_image.dat, <a href="http://username:password@10.10.10.10:80/new_image_path/new_image.dat">http://username:password@10.10.10.10:80/new_image_path/new_image.dat</a> . A valid file name is a text string drawn from alphabet (A-Za-z), digits (0-9), dot (.), hyphen (-), underscore (_). The maximum length is 63 and hyphen must not be first character. The file name content that only contains '.' is not allowed. |
| Certificate Status | Display the current status of certificate on the switch.<br><br>Possible statuses are: <ul style="list-style-type: none"> <li>• Switch secure HTTP certificate is presented.</li> <li>• Switch secure HTTP certificate is not presented.</li> <li>• Switch secure HTTP certificate is generating.</li> </ul>                                                                                                                                                              |

### 4.8.1.6 Access Management Configuration

In this subsection, you may configure the access management configuration.

The maximum number of entries is **16**. If the application type matches any one of the access management entries, it will allow access to the switch.

#### Web GUI: Configuration > Security > Switch > Access Management

**Figure 4-69: Access Management Configuration display**

|                   |                                                                                        |
|-------------------|----------------------------------------------------------------------------------------|
| Interface         | The interface type through which the remote host can access the switch.                |
| Received Packets  | Number of received packets from the interface when access management mode is enabled.  |
| Allowed Packets   | Number of allowed packets from the interface when access management mode is enabled.   |
| Discarded Packets | Number of discarded packets from the interface when access management mode is enabled. |

## 4.8.2 Network Security

Network Security includes the following subjects:

- MAC Limit
- Port Security switch and Port Security port status
- Network Access Server (NAS)
- Access Control List (ACL)
- IP Source Guard ARP Inspection

### 4.8.2.1 MAC Limit Configuration

This section allows you to configure the MAC Limit Control system and port settings.

Limit Control allows for limiting the number of users on a given port. A user is identified by a MAC address and VLAN ID. If Limit Control is enabled on a port, the limit specifies the maximum number of users on the port. (This number cannot exceed 1024). If this number is exceeded, an action takes place. The action can be one of the four different actions as described below. The Limit Control module utilizes a lower-layer module, Port Security module, which manages MAC addresses learnt on the port.

- The Limit Control configuration consists of two sections:
  - System Configuration
  - Port Configuration

| Global Configuration |                                                                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                 | Indicates if <b>Limit Control is globally enabled</b> or disabled on the switch. If globally disabled, other modules may still use the underlying functionality, but limit checks and corresponding actions are disabled. |
| Aging Enabled        | If checked, secured MAC addresses are subject to aging as discussed under <b>Aging Period</b>                                                                                                                             |

|                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aging Period                                                                           | <p>If <b>Aging Enabled</b> is checked, then the aging period is controlled with this input. If other modules are using the underlying port security for securing MAC addresses, they may have other requirements to the aging period. The underlying port security will use the shorter requested aging period of all modules that use the functionality. The Aging Period can be set to a number between 10 and 10,000,000 seconds. To understand why aging may be desired, consider the following scenario: Suppose an end-host is connected to a 3rd party switch or hub, which in turn is connected to a port on this switch on which Limit Control is enabled. The end-host will be allowed to forward if the limit is not exceeded. Now suppose that the end-host logs off or powers down. If it were not for aging, the end-host would still take up resources on this switch and will be allowed to forward. To overcome this situation, enable aging. With aging enabled, a timer is started once the end-host gets secured. When the timer expires, the switch starts looking for frames from the end-host, and if such frames are not seen within the next Aging Period, the end-host is assumed to be disconnected, and the corresponding resources are freed on the switch.</p> |
| Hold Time                                                                              | <p>The hold time - measured in seconds - is used to determine how long a MAC address is held in the MAC table if it has been found to violate the limit. Valid range is between 10 and 10000000 seconds with a default of 300 seconds. The reason for holding a violating MAC address in the MAC table is primarily to ensure that the same MAC address doesn't give rise to continuous notifications (if notifications on violation count is enabled).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p>The table has one row for each port on the selected switch and several columns.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Violation Mode</p>  | <p>If Limit is reached, the switch can take one of the following actions:</p> <ul style="list-style-type: none"> <li>• <b>Protect:</b> Do not allow more than Limit MAC addresses on the port but take no further action.</li> <li>• <b>Restrict:</b> If Limit is reached, subsequent MAC addresses on the port will be counted and marked as violating. Such MAC addresses are removed from the MAC table when the hold time expires. At most Violation Limit MAC addresses can be marked as violating at any given time.</li> <li>• <b>Shutdown:</b> If Limit is reached, one additional MAC address will cause the port to be shut down. This implies that all secured MAC addresses be removed from the port, and no new addresses be learned. There are three ways to re-open the port:</li> </ul> <p>1) In the "Configuration → Ports" page's "Configured" column, first disable the port, then restore the original mode.</p> <p>2) Make a Port Security configuration change on the port.</p> <p>3) Boot the switch.</p> |
| <p>Violation Limit</p> | <p>The maximum number of MAC addresses that can be marked as violating on this port. This number cannot exceed 1023. Default is 4. It is only used when Violation Mode is <b>Restrict</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p>Sticky</p>          | <p>Enables sticky learning of MAC addresses on this port. When the port is in sticky mode, all MAC addresses that would otherwise have been learned as dynamic are learned as sticky.</p> <p>Sticky MAC addresses are part of the running-config and can therefore be saved to startup-config. Sticky MAC addresses survive link changes (in contrast to Dynamic, which will have to be learned again). They also survive reboots if running-config is saved to startup-config.</p> <p>A port can be Sticky-enabled whether or not Port Security is enabled on that interface. In that way, it is possible to add sticky MAC addresses management-wise before enabling Port Security. To do that, use the "Configuration→Security→Port Security→MAC Addresses" page.</p>                                                                                                                                                                                                                                                         |
| <p>State</p>           | <p>This column shows the current state of the port as seen from the Limit Control's point of view. The state takes one of four values:</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> Limit Control is either globally disabled or disabled on the port.</li> <li>• <b>Ready:</b> The limit is not yet reached. This can be shown for all actions.</li> <li>• <b>Limit Reached:</b> Indicates that the limit is reached on this port. This state can only be shown if Action is set to None or Trap.</li> </ul> <p><b>Shutdown:</b> Indicates that the port is shut down by the Limit Control module. This state can only be shown if Action is set to Shut down or Trap &amp; Shutdown.</p>                                                                                                                                                                                                                                                                                                                      |

|                |                                                                                                                                                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Re-open Button | <p>If a port is shut down by this module, you may reopen it by clicking this button, which will only be enabled if this is the case. For other methods, refer to Shut down in the Action section.</p> <hr/> <p><i>Note that clicking the reopen button causes the page to be refreshed, so non-committed changes will be lost.</i></p> <hr/> |

#### 4.8.2.2 Port Security Switch Status

This section shows the Port Security status. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

The status page is divided into two sections - one with a legend of user modules and one with the actual port status.

**Web GUI: Monitor > Security > Network > Port Security > Overview**

**Port Security Switch Status**

Click the port number to see the status for this port.</p> <p>Refer to next page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Users                                | <p>Each of the user modules has a column that shows whether that module has enabled Port Security or not. A '-' means that the corresponding user module is not enabled, whereas a letter indicates that the user module abbreviated by that letter (see Abbr above) has enabled port security.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Violation Mode                       | <p>Shows the configured Violation Mode of the port. It can take one of four values:</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> Port Security is not administratively enabled on this port.</li> <li>• <b>Protect:</b> Port Security is administratively enabled in Protect mode.</li> <li>• <b>Restrict:</b> Port Security is administratively enabled in Restrict mode.</li> <li>• <b>Shutdown:</b> Port Security is administratively enabled in Shutdown mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                          |
| State                                | <p>Shows the current state of the port. It can take one of four values:</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> No user modules are currently using the Port Security service.</li> <li>• <b>Ready:</b> The Port Security service is in use by at least one user module and is awaiting the arrival of frames from unknown MAC addresses.</li> <li>• <b>Limit Reached:</b> The Port Security service is enabled by at least the Limit Control user module, and that module has indicated that the limit is reached, and no more MAC addresses should be taken in.</li> <li>• <b>Shutdown:</b> The Port Security service is enabled by at least the Limit Control user module, and that module has indicated that the limit is exceeded. No MAC addresses can be learned on the port until it is administratively re-opened on the Limit Control configuration Webpage.</li> </ul> |
| Mac Count (Current, Violating Limit) | <p>The three columns indicate the number of currently learned MAC addresses (forwarding as well as blocked), the number of violating MAC address (only counting in Restrict mode) and the maximum number of MAC addresses that can be learned on the port, respectively.</p> <p>If no user modules are enabled on the port, the Current column will show a dash (-).</p> <p>If Port Security is not administratively enabled on the port, the Violating and Limit columns will show a dash (-).</p>                                                                                                                                                                                                                                                                                                                                                                                                     |

#### 4.8.2.3 Port Security Port Status

This section shows the MAC addresses secured by the Port Security module. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

Notice that if you have added static or sticky MAC addresses, they will show up on this page only if Port Security is enabled on the interface to which they pertain.

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                | Click to remove this particular MAC addresses from MAC address table. The button is only clickable if the entry type is Dynamic. Use the "Configuration→ Security→ Port Security→MAC Addresses" page to remove Static and Sticky entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Port                  | If all ports are shown (can be selected through the drop-down box on the top right), this one shows the port to which the MAC address is bound.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MAC Address & VLAN ID | The MAC address and VLAN ID that is seen on this port. If no MAC addresses are learned, a single row stating "No MAC addresses attached" is displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Type                  | Indicates the type of entry. Takes one of three values: <ul style="list-style-type: none"> <li>• <b>Dynamic:</b> The entry is learned through learn frames coming to the Port Security module while the port in question is not in sticky mode.</li> <li>• <b>Static:</b> The entry is entered by the end-user through management. Entry is not subject to aging.</li> <li>• <b>Sticky:</b> When the port is in sticky mode, all entries that would otherwise have been learned as dynamic are learned as sticky.</li> <li>• Sticky entries are part of the running-config and can therefore be saved to startup-config. An important aspect of sticky MAC addresses is that they survive link changes (in contrast to Dynamic, which will have to be learned again). They also survive reboots if running-config is saved to startup-config.</li> </ul> |
| State                 | Indicates whether the corresponding MAC address is violating (administrative user has configured the interface in "Restrict" mode and the MAC address is blocked), blocked, or forwarding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Time of Addition      | Shows the date and time when this MAC address was first seen on the port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Age/Hold              | If at least one user module has decided to block this MAC address, it will stay in the blocked state until the hold time (measured in seconds) expires. If all user modules have decided to allow this MAC address to forward, and aging is enabled, the Port Security module will periodically check that this MAC address still forwards traffic. If the age period (measured in seconds) expires and no frames have been seen, the MAC address will be removed from the MAC table. Otherwise, a new age period will begin.<br><br>If aging is disabled or a user module has decided to hold the MAC address indefinitely, a dash (-) will be shown.                                                                                                                                                                                                   |

### 4.8.2.4 Network Access Server Configuration

This page allows you to configure the IEEE 802.1X and MAC-based authentication system and port settings.

The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more central servers, the backend servers, determine whether the user is allowed access to the network. These backend (RADIUS) servers are configured on the "[Configuration → Security → AAA](#)" section. The IEEE802.1X standard defines port-based operation, but non-standard variants overcome security limitations as shall be explored below

MAC-based authentication allows for authentication of more than one user on the same port and does not require the user to have special 802.1X supplicant software installed on his system. The switch uses the user's MAC address to authenticate against the backend server. Intruders can create counterfeit MAC addresses, which makes MAC-based authentication less secure than 802.1 X authentications

The NAS configuration consists of two sections, System and Port Configurations.

#### Network Access Server Configuration

##### System Configuration

|                                |                          |         |

Figure 4-74: Network Access Server Configuration

Table 4-70: Network Access Server Configuration Parameters

| System Configuration     |                                                                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                     | Indicates if NAS is globally enabled or disabled on the switch If globally disabled, all ports are allowed forwarding of frames.                                                                                                                                                                    |
| Reauthentication Enabled | If checked, successfully authenticated supplicants/clients are reauthenticated after the interval specified by the Reauthentication Period. Reauthentication for 802.1X-enabled ports can be used to detect if a new device is plugged into a switch port or if a supplicant is no longer attached. |

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                         | For MAC-based ports, reauthentication is only useful if the RADIUS server configuration has changed. It does not involve communication between the switch and the client, and therefore doesn't imply that a client is still present on a port (see <b>Aging Period</b> below)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Reauthentication Period | Determines the period, in seconds, after which a connected client must be reauthenticated. This is only active if the Reauthentication Enabled checkbox is checked. Valid values are in the range 1 to 3600 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| EAPOL Timeout           | Determines the time for retransmission of Request Identity EAPOL frames.<br>Valid values are in the range 1 to 65535 seconds. This has no effect for MAC-based ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Aging Period            | <p>This setting applies to the following modes, i.e., modes using the Port Security functionality to secure MAC addresses:</p> <ul style="list-style-type: none"> <li>• Single 802.1X</li> <li>• Multi 802.1X</li> <li>• MAC-Based Auth.</li> </ul> <p>When the NAS module uses the Port Security module to secure MAC addresses, the Port Security module needs to check for activity on the MAC address in question at regular intervals and free resources if no activity is seen within a given period. This parameter controls exactly this period and can be set to a number between 10 and 1000000 seconds.</p> <p>If reauthentication is enabled and the port is in an 802.1X-based mode, this is not so critical, since supplicants that are no longer attached to the port will get removed upon the next reauthentication, which will fail. But if reauthentication is not enabled, the only way to free resources is by aging the entries. For ports in MAC-based Auth. mode, reauthentication does not cause direct communication between the switch and the client, so this will not detect whether the client is still attached or not, and the only way to free any resources is to age the entry.</p> |
| Hold Time               | <p>This setting applies to the following modes, i.e., modes using the Port Security functionality to secure MAC addresses:</p> <ul style="list-style-type: none"> <li>• Single 802.1X</li> <li>• Multi 802.1X</li> <li>• MAC-Based Auth.</li> </ul> <p>If a client is denied access - either because the RADIUS server denies the client access or because the RADIUS server request times out (according to the timeout specified on the "<a href="#">Configuration→Security→AAA</a>") the client is put on hold in the Unauthorized state. The hold timer does not count during an on-going authentication.</p> <p>In MAC-based Auth. mode, the switch will ignore new frames coming from the client during the hold time. The Hold Time can be set to a number between 10 and 1000000 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>RADIUS-Assigned QoS Enabled</p>    | <p>RADIUS-assigned QoS provides a means to centrally control the traffic class to which traffic coming from a successfully authenticated supplicant is assigned on the switch. The RADIUS server must be configured to transmit special RADIUS attributes to take advantage of this feature (Refer to RADIUS-Assigned QoS Enabled within Port Configuration-see below) for a detailed description).</p> <p>The "RADIUS-Assigned QoS Enabled" checkbox provides a quick way to globally enable/disable RADIUS-server assigned QoS Class functionality. When checked, the individual ports' ditto setting determines whether RADIUS-assigned QoS Class is enabled on that port. When unchecked, RADIUS-server assigned QoS Class is disabled on all ports.</p>                             |
| <p>RADIUS-Assigned VLAN Enabled</p>   | <p>RADIUS-assigned VLAN provides a means to centrally control the VLAN on which a successfully authenticated supplicant is placed on the switch. Incoming traffic will be classified to and switched on the RADIUS-assigned VLAN. The RADIUS server must be configured to transmit special RADIUS attributes to take advantage of this feature (see RADIUS-Assigned VLAN Enabled within Port Configuration below) for a detailed description.</p> <p>The "RADIUS-Assigned VLAN Enabled" checkbox provides a quick way to globally enable/disable RADIUS-server assigned VLAN functionality. When checked, the individual ports' ditto setting determines whether RADIUS-assigned VLAN is enabled on that port. When unchecked, RADIUS-server assigned VLAN is disabled on all ports.</p> |
| <p>Guest VLAN Enabled</p>             | <p>A Guest VLAN is a special VLAN - typically with limited network access - on which 802.1X-unaware clients are placed after a network administrator-defined timeout. The switch follows a set of rules for entering and leaving the Guest VLAN as listed <u>below</u>.</p> <p>The "Guest VLAN Enabled" checkbox provides a quick way to globally enable/disable Guest VLAN functionality. When checked, the individual ports' ditto setting determines whether the port can be moved into Guest VLAN. When unchecked, the ability to move to the Guest VLAN is disabled on all ports.</p>                                                                                                                                                                                               |
| <p>Guest VLAN ID</p>                  | <p>This is the value that a port's Port VLAN ID is set to if a port is moved into the Guest VLAN. It is only changeable if the Guest VLAN option is globally enabled. Valid values are in the range [1; 4095].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p>Max. Reauth. Count</p>             | <p>The number of times the switch transmits an EAPOL Request Identity frame without response before considering entering the Guest VLAN is adjusted with this setting. The value can only be changed if the Guest VLAN option is globally____enabled. Valid values are in the range [1; 255].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p>Allow Guest VLAN if EAPOL Seen</p> | <p>The switch remembers if an EAPOL frame has been received on the port for the lifetime of the port. Once the switch considers whether to enter the Guest VLAN, it will first check if this option is enabled or disabled.</p> <p>If disabled (unchecked; default), the switch will only enter the Guest VLAN if an EAPOL frame has not been received on the port for the lifetime of the port. If enabled (checked), the switch will consider</p>                                                                                                                                                                                                                                                                                                                                      |

entering the Guest VLAN even if an EAPOL frame has been received on the port for the lifetime of the port. The value can only be changed if the Guest VLAN option is globally enabled.

**Port Configuration**

The table below has one row for each port on the switch several columns

|      |                                                            |
|------|------------------------------------------------------------|
| Port | The port number for which the configuration below applies. |
|------|------------------------------------------------------------|

**Admin State**

If NAS is globally enabled, this selection controls the port's authentication mode. The following modes are available:

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Force Authorized</b>   | In this mode, the switch will send one EAPOL Success frame when the port link comes up, and any client on the port will be allowed network access without authentication                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Force Unauthorized</b> | In this mode, the switch will send one EAPOL Failure frame when the port link comes up, and any client on the port will be disallowed network access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Port-based 802.1X</b>  | In the 802.1X-world, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The authenticator acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as EAPOL (EAP Over LANs) frames. EAPOL frames encapsulate EAP PDUs (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's |

|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                             | <p>IP address, name, and the supplicant's port number on the switch. EAP is very flexible, in that it allows for different authentication methods, like MD5-Challenge, PEAP, and TLS. The important thing is that the authenticator (the switch) does not need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it. When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding this decision to the supplicant, the switch uses it to open or block traffic on the switch port connected to the supplicant.</p> <hr/> <p><i>Note: Suppose two backend servers are enabled and that the server timeout is configured to X seconds (using the AAA configuration page) and suppose that the first server in the list is currently down (but not considered dead). Now, if the supplicant retransmits EAPOL Start frames at a rate faster than X seconds, then it will never get authenticated, because the switch will cancel on-going backend authentication server requests whenever it receives a new EAPOL Start frame from the supplicant. And since the server has not yet failed (because the X seconds have not expired), the same server will be contacted upon the next backend authentication server request from the switch. This scenario will loop forever. Therefore, the server timeout should be smaller than the supplicant's EAPOL Start frame retransmission rate.</i></p> <hr/> |
| <p><b>Single 802.1X</b></p> | <p>In port-based 802.1X authentication, once a supplicant is successfully authenticated on a port, the whole port is opened for network traffic. This allows other clients connected to the port (for instance through a hub) to piggy-back on the successfully authenticated client and get network access even though they really are not authenticated. To overcome this security breach, use the Single 802.1X variant.</p> <p>Single 802.1X is not an IEEE standard, but features many of the same characteristics as does port-based 802.1X. In Single 802.1X, at most one supplicant can get authenticated on the port at a time. Normal EAPOL frames are used in the communication between the supplicant and the switch. If more than one supplicant is connected to a port, the one that comes first when the port's link comes up will be the first one considered.</p> <p>If that supplicant does not provide valid credentials within a certain amount of time, another supplicant will get a chance. Once a supplicant is successfully authenticated, only that supplicant will be allowed access. This is the most secure of all the supported modes. In this mode, the Port Security module is used to secure a supplicant's MAC address once successfully authenticated</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <p><b>Multi 802.1X</b></p>    | <p>Multi 802.1X is - like Single 802.1X - not an IEEE standard, but a variant that features many of the same characteristics. In Multi 802.1X, one or more supplicants can get authenticated on the same port at the same time. Each supplicant is authenticated individually and secured in the MAC table using the Port Security module.</p> <p>In Multi 802.1X it is not possible to use the multicast BPDU MAC address as destination MAC address for EAPOL frames sent from the switch towards the supplicant, since that would cause all supplicants attached to the port to reply to requests sent from the switch. Instead, the switch uses the supplicant's MAC address, which is obtained from the first EAPOL Start or EAPOL Response Identity frame sent by the supplicant.</p> <p>An exception to this is when no supplicants are attached. In this case, the switch sends EAPOL Request Identity frames using the BPDU multicast MAC address as destination - to wake up any supplicants that might be on the port. The maximum number of clients that can be attached to a port can be limited using the Port Security Limit Control functionality.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>MAC-based Auth.</b></p> | <p>Unlike port-based 802.1X, MAC-based authentication is not a standard, but merely a best-practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients.</p> <p>The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string on the following form "xx-xx-xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly.</p> <p>When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using the Port Security module. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based Authentication has nothing to do with the 802.1X standard.</p> <p>The advantage of MAC-based authentication over port-based 802.1X is that several clients can be connected to the same port (e.g., through a 3rd party switch or a hub) and still require individual authentication, and that the clients do not need special supplicant software to authenticate.</p> <p>The advantage of MAC-based authentication over 802.1X-based authentication is that the clients do not need special supplicant software to authenticate.</p> <p>The disadvantage is that MAC addresses can be spoofed by malicious users - equipment whose MAC address is a valid RADIUS user can be used by anyone. Also, only the MD5-Challenge method is supported.</p> |

|                                  | <p>RADIUS attributes used in identifying a VLAN ID:</p> <p>RFC2868 and RFC3580 form the basis for the attributes used in identifying a VLAN ID in an Access-Accept packet. The following criteria are used:</p> <p>The Tunnel-Medium-Type, Tunnel-Type, and Tunnel-Private-Group-ID attributes must all be present at least once in the Access-Accept packet.</p> <p>The switch looks for the first set of these attributes that have the same Tag value and fulfil the following requirements (if Tag == 0 is used, the Tunnel-Private-Group-ID does not need to include a Tag):</p> <ul style="list-style-type: none"> <li>- Value of Tunnel-Medium-Type must be set to "IEEE-802" (ordinal 6).</li> <li>- Value of Tunnel-Type must be set to "VLAN" (ordinal 13).</li> <li>- Value of Tunnel-Private-Group-ID must be a string of ASCII chars in the range '0' - '9', which is interpreted as a decimal string representing the VLAN ID. Leading '0's are discarded. The final value must be in the range [1; 4095].</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>Guest VLAN Enabled</b></p> | <p>When Guest VLAN is both globally enabled and enabled (checked) for a given port, the switch considers moving the port into the Guest VLAN according to the rules outlined below. This option is only available for EAPOL-based modes, i.e.:</p> <ul style="list-style-type: none"> <li>• Port-based 802.1X</li> <li>• Single 802.1X</li> <li>• Multi 802.1X</li> </ul> <p>For troubleshooting VLAN assignments, use the " → VLANs → VLAN Membership Status and VLAN Port Status" pages. These pages show which modules have (temporarily) overridden the current Port VLAN configuration.</p> <p>Guest VLAN Operation:</p> <p>When a Guest VLAN enabled port's link comes up, the switch starts transmitting EAPOL Request Identity frames. If the number of transmissions of such frames exceeds Max. Reauth. Count (refer to System Configuration above) and no EAPOL frames have been received in the meanwhile, the switch considers entering the Guest VLAN. The interval between transmission of EAPOL Request Identity frames is configured with EAPOL Timeout. If Allow Guest VLAN if EAPOL Seen (refer to System Configuration above) is enabled, the port will now be placed in the Guest VLAN. If disabled, the switch will first check its history to see if an EAPOL frame has previously been received on the port (this history is cleared if the port link goes down or the port's Admin State is changed -Refer to Port Configuration), and if not, the port will be placed in the Guest VLAN. Otherwise, it will not move to the Guest VLAN, but continue transmitting EAPOL Request Identity frames at the rate given by EAPOL Timeout.</p> <p>Once in the Guest VLAN, the port is considered authenticated, and all attached clients on the port are allowed access on this VLAN. The switch will not transmit an EAPOL Success frame when entering the Guest VLAN.</p> |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <p>While in the Guest VLAN, the switch monitors the link for EAPOL frames, and if one such frame is received, the switch immediately takes the port out of the Guest VLAN and starts authenticating the supplicant according to the port mode. If an EAPOL frame is received, the port will never be able to go back into the Guest VLAN if the "Allow Guest VLAN if EAPOL Seen" is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b>Port State</b></p> | <p>The current state of the port. It can undertake one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Globally Disabled:</b> NAS is globally disabled. Link Down: NAS is globally enabled, but there is no link on the port.</li> <li>• <b>Authorized:</b> The port is in Force Authorized (Refer to Port Configuration above) or a single-supplicant mode and the supplicant is authorized.</li> <li>• <b>Unauthorized:</b> The port is in Force Unauthorized ((Refer to Port Configuration above) or a single-supplicant mode and the supplicant is not successfully authorized by the RADIUS server.</li> <li>• <b>X Auth/Y Unauth:</b> The port is in a multi-supplicant mode. Currently X clients are authorized, and Y are unauthorized.</li> </ul>                                                                                                                                                                                                                                      |
| <p><b>Restart</b></p>    | <p>Two buttons are available for each row. The buttons are only enabled when authentication is globally enabled and the port's Admin State (Refer to beginning of Port Configuration above) is in an EAPOL-based or MAC-based mode (Refer to f Port Configuration above).</p> <p>Clicking these buttons will not cause settings changed on the page to take effect.</p> <ul style="list-style-type: none"> <li>• <b>Reauthenticate:</b> Schedules a reauthentication whenever the quiet-period of the port runs out (EAPOL-based authentication). For MAC-based authentication, reauthentication will be attempted immediately. The button only has effect for successfully authenticated clients on the port and will not cause the clients to get temporarily unauthorized.</li> <li>• <b>Reinitialize:</b> Forces a reinitialization of the clients on the port and thereby a reauthentication immediately. The clients will transfer to the unauthorized state while the reauthentication is in progress.</li> </ul> |

#### 4.8.2.5 Network Access Server Switch Status

This section provides an overview of the current NAS port states for the selected switch.

Web GUI: Monitor > Security > Network > NAS

### Network Access Server Switch Status

| Port              | Admin State      | Port State        | Last Source | Last ID | QoS Class | Port VLAN ID |
|-------------------|------------------|-------------------|-------------|---------|-----------|--------------|
| <a href="#">1</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">2</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">3</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">4</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">5</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">6</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">7</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">8</a> | Force Authorized | Globally Disabled |             |         | -         |              |
| <a href="#">9</a> | Force Authorized | Globally Disabled |             |         | -         |              |

Refer to next section.                                                                                                                                                                                                                                                                                                                                                                                |
| Admin State  | The port's current administrative state. Refer to NAS <b>Admin State</b> for a description of possible values <a href="#">Network Access Server Configuration</a> .                                                                                                                                                                                                                                                                                                                       |
| Port State   | The current state of the port. Refer to NAS <b>Port State</b> for a description of the individual states. <a href="#">Network Access Server Configuration</a> .                                                                                                                                                                                                                                                                                                                           |
| Last Source  | The source MAC address carried in the most recently received EAPOL frame for EAPOL-based authentication, and the most recently received frame from a new client for MAC-based authentication.                                                                                                                                                                                                                                                                                             |
| Last ID      | The username (supplicant identity) carried in the most recently received Response Identity EAPOL frame for EAPOL-based authentication, and the source MAC address from the most recently received frame from a new client for MAC-based authentication.                                                                                                                                                                                                                                   |
| QoS Class    | QoS Class assigned to the port by the RADIUS server if enabled.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Port VLAN ID | The VLAN ID that NAS has put the port in. The field is blank, if the Port VLAN ID is not overridden by NAS.<br>If the VLAN ID is assigned by the RADIUS server, "(RADIUS-assigned)" is appended to the VLAN ID. (Read more about <a href="#">RADIUS-assigned VLANs</a> at previous section. System Configuration).<br>If the port is moved to the <a href="#">Guest VLAN</a> , "(Guest)" is appended to the VLAN ID. Read more about Guest VLANs (previous section System Configuration). |

#### 4.8.2.6 NAS Port Statistics

This section provides detailed NAS statistics for a specific switch port running EAPOL-based IEEE 802.1X authentication. For MAC-based ports, it shows selected backend server (RADIUS Authentication Server) statistics only.

Use the port select box to select which port details to be displayed.

Web GUI: Monitor > Security > Network > NAS > Port

|----|----------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Rx | Responses      | dot1xAuthEapolRespFramesRx      | The number of valid EAPOL response frames (other than Response Identity frames) that have been received by the switch.  |
| Rx | Start          | dot1xAuthEapolStartFramesRx     | The number of EAPOL Start frames that have been received by the switch.                                                 |
| Rx | Logoff         | dot1xAuthEapolLogoffFramesRx    | The number of valid EAPOL Logoff frames that have been received by the switch.                                          |
| Rx | Invalid Type   | dot1xAuthInvalidEapolFramesRx   | The number of EAPOL frames that have been received by the switch in which the frame type is not recognized.             |
| Rx | Invalid Length | dot1xAuthEapLengthErrorFramesRx | The number of EAPOL frames that have been received by the switch in which the Packet Body Length field is invalid.      |
| Tx | Total          | dot1xAuthEapolFramesTx          | The number of EAPOL frames of any type that have been transmitted by the switch.                                        |
| Tx | Request ID     | dot1xAuthEapolReqIdFramesTx     | The number of EAPOL Request Identity frames that have been transmitted by the switch.                                   |
| Tx | Requests       | dot1xAuthEapolReqFramesTx       | The number of valid EAPOL Request frames (other than Request Identity frames) that have been transmitted by the switch. |

### Backend Server Counters

This backend (RADIUS) frame counters are available for the following administrative states:

- Port-based 802.1X
- Single 802.1X
- Multi 802.1X
- MAC-based Auth

### Backend Server Counters

| Direction | Name              | IEEE Name                        | Description                                                                                                                                                                                                                                                                      |

Indicates the switch attempted communication with the backend server. Possible retransmissions are not counted.</p> <p><b>MAC-based:</b></p> <p>Counts all the backend server packets sent from the switch towards the backend server for a given port (left-most table) or client (right-most table). Possible retransmissions are not counted.</p> |

**Last Supplicant/ Client Info**

Last Supplicant/Client Info

Information about the last supplicant/client that attempted to authenticate. This information is available for the following administrative states: (Refer to section 4.9.2.2 Port Configuration)

- Port-based 802.1X
- Single 802.1X
- Multi 802.1X
- MAC-based Auth

#### 4.8.2.7 ACL Ports Configuration

Configure the ACL Parameters (ACE) of each switch port. These Parameters will affect frames received on a port unless the frame matches a specific ACE.

---

*Note: For a detailed explanation of ACL and ACE terms, refer to the Glossary of Terms at the end of this manual*

---

**Web GUI: Configuration > Security > Network > ACL > Ports**

**ACL Ports Configuration**

| Port | Policy ID | Action | Rate Limiter ID | Port Redirect                | Mirror   | Logging  | Shutdown | State   | Counter |
|------|-----------|--------|-----------------|------------------------------|----------|----------|----------|---------|---------|
| *    | 0         | <>     | <>              | Disabled<br>Port 1<br>Port 2 | <>       | <>       | <>       | <>      | *       |
| 1    | 0         | Permit | Disabled        | Disabled<br>Port 1<br>Port 2 | Disabled | Disabled | Disabled | Enabled | 0       |

|                 |                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port            | The logical port for the settings contained in the same row.                                                                                                                                                                                                                                                                                                                    |
| Policy ID       | Select the policy to apply to this port. The allowed values are 0 through 255. The default value is 0.                                                                                                                                                                                                                                                                          |
| Action          | Select whether forwarding is permitted ("Permit") or denied ("Deny"). The default value is <b>Permit</b> .                                                                                                                                                                                                                                                                      |
| Rate Limiter ID | Select which rate limiter to apply on this port. The allowed values are Disabled or the values <b>1</b> through <b>16</b> . The default value is <b>Disabled</b> .                                                                                                                                                                                                              |
| Port Redirect   | Select which port frames are redirected on. The allowed values are Disabled or a specific port number. The default value is <b>Disabled</b> .                                                                                                                                                                                                                                   |
| Mirror          | Specify the mirror operation of this port. The allowed values are: <ul style="list-style-type: none"> <li><b>Enabled:</b> Frames received on the port are mirrored.</li> <li><b>Disabled:</b> Frames received on the port are not mirrored. The default value is <b>Disabled</b>.</li> </ul>                                                                                    |
| Logging         | Specify the logging operation of this port. The allowed values are: <ul style="list-style-type: none"> <li><b>Enabled:</b> Frames received on the port are stored in the System Log.</li> <li><b>Disabled:</b> Frames received on the port are not logged. The default value is "Disabled". Please note that the System Log memory size and logging rate is limited.</li> </ul> |

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shutdown | <p>Specify the port shut down operation of this port. The allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> If a frame is received on the port, the port will be disabled.</li> <li>• <b>Disabled:</b> Port shut down is disabled.</li> </ul> <p>The default value is <b>Disabled</b>.</p> <hr/> <p><i>Note: The shutdown feature only works when the packet length is less than 1518(without VLAN tags).</i></p> <hr/> |
| State    | <p>Specify the port state of this port. The allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> To reopen ports by changing the volatile port configuration of the ACL user module.</li> <li>• <b>Disabled:</b> To close ports by changing the volatile port configuration of the ACL user module. The default value is <b>Enabled</b>.</li> </ul>                                                                        |
| Counter  | Counts the number of frames that match this ACE.                                                                                                                                                                                                                                                                                                                                                                                                       |

#### 4.8.2.8 Configuration

Configure the rate limiter for the ACL of the switch.

**Web GUI: Monitor > Security > Network > ACL > Rate Limiters**

#### ACL Rate Limiter Configuration

| Rate Limiter ID | Rate | Unit          |
|-----------------|------|---------------|

|                 |                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------|
| Rate Limiter ID | The rate limiter ID for the settings contained in the same row. and its range is <b>1 to 16</b> .  |
| Rate            | The allowed values are: <b>0-3276700</b> in PPS, or <b>0, 100, 200, 300, ..., 1000000</b> in KBPS. |

|      |                                                                                                                                                                              |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unit | Specify the rate unit. The allowed values are: <ul style="list-style-type: none"> <li>• <b>PPS</b>: packets per second.</li> <li>• <b>LBPS</b>: Kbits per second.</li> </ul> |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.8.2.9 Access Control List Configuration

This section shows the Access Control List ([ACL](#)), which is made up of the ACEs defined on this switch. Each row describes the ACE that is defined. The maximum number of ACEs is 256 on each switch.

**Click on the lowest plus sign to add a new ACE to the list.** The reserved ACEs used for internal protocol, cannot be edited or deleted, the order sequence cannot be changed, and the priority is highest.

**Web GUI: Monitor > Security > Network > ACL > Access Control List**

#### Access Control List Configuration

| ACE | Ingress Port | Policy / Bitmask | Frame Type | Action | Rate Limiter | Port Redirect | Mirror | Counter |   |
|-----|--------------|------------------|------------|--------|--------------|---------------|--------|---------|---|
|     |              |                  |            |        |              |               |        |         | + |

Auto-refresh  Refresh Clear Remove All

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACE              | Indicates the ACE ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Ingress Port     | Indicates the ingress port of the ACE. Possible values are: <ul style="list-style-type: none"> <li>• <b>All</b>: The ACE will match all ingress port.</li> <li>• <b>Port</b>: The ACE will match a specific ingress port.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Policy / Bitmask | Indicates the policy number and bitmask of the ACE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Frame Type       | Indicates the frame type of the ACE. Possible values are: <ul style="list-style-type: none"> <li>• <b>Any</b>: The ACE will match any frame type.</li> <li>• <b>EType</b>: The ACE will match <u>Ethernet Type</u> frames. Note that an Ethernet Type based ACE will not get matched by IP and ARP frames.</li> <li>• <b>ARP</b>: The ACE will match ARP/RARP frames</li> <li>• <b>IPv4</b>: The ACE will match all IPv4 frames.</li> <li>• <b>IPv4/ICMP</b>: The ACE will match IPv4 frames with ICMP protocol.</li> <li>• <b>IPv4/UDP</b>: The ACE will match IPv4 frames with UDP protocol.</li> <li>• <b>IPv4/TCP</b>: The ACE will match IPv4 frames with TCP protocol.</li> <li>• <b>IPv4/Other</b>: The ACE will match IPv4 frames, which are not ICMP/UDP/TCP.</li> <li>• <b>IPv6</b>: The ACE will match all IPv6 standard frames.</li> </ul> |
| Action           | Indicates the forwarding action of the ACE. <ul style="list-style-type: none"> <li>• <b>Permit</b>: Frames matching the ACE may be forwarded and learned.</li> <li>• <b>Deny</b>: Frames matching the ACE are dropped.</li> <li>• <b>Filter</b>: Frames matching the ACE are filtered.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Rate Limiter     | Indicates the rate limiter number of the ACE. The allowed range is <b>1</b> to <b>16</b> . When <b>Disabled</b> is displayed, the rate limiter operation is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                     |                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Redirect       | Indicates the port redirect operation of the ACE. Frames matching the ACE are redirected to the port number. The allowed values are <b>Disabled</b> or a specific port number. When <b>Disabled</b> is displayed, the port redirect operation is disabled.                                                                                                       |
| Mirror              | Specify the mirror operation of this port. Frames matching the ACE are mirrored to the destination mirror port. The allowed values are: <ul style="list-style-type: none"> <li>• <b>Enabled</b>: Frames received on the port are mirrored.</li> <li>• <b>Disabled</b>: Frames received on the port are not mirrored.</li> </ul> The default value is "Disabled." |
| Counter             | The counter indicates the number of times the ACE was hit by a frame.                                                                                                                                                                                                                                                                                            |
| Modification Button |  : The lowest plus sign adds a new entry at the bottom of the ACE listings. By checking this box, you access additional displays (ACE configuration, VLAN Parameters).                                                                                                          |

---

*Note: Refer to the [Alphabetic Glossary of Terms](#) for explanation of all underlined terms in the above section.*

By clicking on the : The lowest plus sign adds a new entry at the bottom of the ACE listings. Refer to next page.

#### 4.8.2.10 ACE Configuration

Configure an ACE (Access Control Entry) on this section. An ACE consists of several parameters. These parameters vary according to the frame type that you select. First select the ingress port for the ACE, and then select the frame type. Different parameter options are displayed depending on the frame type selected.

A frame that hits this ACE matches the configuration that is defined here.

Web GUI: Configuration > Security > Network > ACL > Access Control List

| ACE Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Second Lookup     | Specify the second lookup operation of the ACE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Ingress Port      | Select the ingress port for which this ACE applies. <ul style="list-style-type: none"> <li><b>All:</b> The ACE applies to all port.</li> <li><b>Port:</b> The ACE applies to this port number, where <i>n</i> is the number of the switch port.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Policy Filter     | Specify the policy number filter for this ACE. <ul style="list-style-type: none"> <li><b>Any:</b> No policy filter is specified. (Policy filter status is "don't-care".)</li> <li><b>Specific:</b> If you want to filter a specific policy with this ACE, choose this value. Two field for entering a policy value and bitmask appears.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Frame Type        | Select the frame type for this ACE. These frames are mutually exclusive: <ul style="list-style-type: none"> <li><b>Any:</b> Any frame can match this ACE.</li> <li><b>Ethernet Type:</b> Only Ethernet Type frames can match this ACE. The IEEE 802.3 describes the value of Length/Type Field specifications to be greater than or equal to 1536 decimal (equal to 0600 hexadecimal) and the value should not be equal to 0x800(IPv4), 0x806(ARP) or 0x86DD(IPv6).</li> <li><b>ARP:</b> Only ARP frames can match this ACE. Notice the ARP frames will not match the ACE with ethernet type.</li> <li><b>IPv4:</b> Only IPv4 frames can match this ACE. Notice the IPv4 frames will not match the ACE with ethernet type.</li> <li><b>IPv6:</b> Only IPv6 frames can match this ACE. Notice the IPv6 frames will not match the ACE with Ethernet type.</li> </ul> |

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action       | <p>Specify the action to take with a frame that hits this ACE.</p> <ul style="list-style-type: none"> <li>• <b>Permit:</b> The frame that hits this ACE is granted permission for the ACE operation.</li> <li>• <b>Deny:</b> The frame that hits this ACE is dropped.</li> <li>• <b>Filter:</b> Frames matching the ACE are filtered.</li> </ul>                                                                                                                                                                                           |
| Rate Limiter | <p>Select whether the rate limiter in number of base units. The allowed range is <b>1 to 16</b>. <b>Disabled</b> indicates that, the rate limiter operation is disabled</p>                                                                                                                                                                                                                                                                                                                                                                |
| EVC Policer  | <p>Select whether EVC policer is enabled or disabled. The default value is <b>Disabled</b>. Note that the ACL rate limiter and EVC policer cannot both be enabled.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| Mirror       | <p>Specify the mirror operation of this port. Frames matching the ACE are mirrored to the destination mirror port. The rate limiter will not affect frames on the mirror port. The allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Frames received on the port are mirrored.</li> <li>• <b>Disabled:</b> Frames received on the port are not mirrored.</li> </ul> <p>The default value is "Disabled".</p>                                                                                                 |
| Logging      | <p>Specify the logging operation of the ACE. Notice that the logging message does not include the 4 bytes CRC information. The allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Frames matching the ACE are stored in the System Log.</li> <li>• <b>Disabled:</b> Frames matching the ACE are not logged.</li> </ul> <hr/> <p><i>Note: The logging feature only works when the packet length is less than 1518(without VLAN tags) and the System Log memory size and logging rate is limited</i></p> <hr/> |
| Shutdown     | <p>Specify the port shut down operation of the ACE. The allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> If a frame matches the ACE, the ingress port will be disabled.</li> <li>• <b>Disabled:</b> Port shut down is disabled for the ACE.</li> </ul> <hr/> <p><i>Note: The shutdown feature only works when the packet length is less than 1518(without VLAN tags).</i></p> <hr/>                                                                                                                        |
| Counter      | <p>The counter indicates the number of times the ACE was hit by a frame.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| VLAN Parameters |                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 802.1Q Tagged   | <p>Specify whether frames can hit the action according to the 802.1Q tagged. The allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>Any:</b> Any value is allowed ("don't-care").</li> <li>• <b>Enabled:</b> Tagged frame only.</li> <li>• <b>Disabled:</b> Untagged frame only.</li> </ul> <p>The default value is "Any".</p> |
| VLAN ID Filter  | <p>Specify the VLAN ID filter for this ACE.</p> <ul style="list-style-type: none"> <li>• <b>Any:</b> No VLAN ID filter is specified. (VLAN ID filter status is "don't-care".)</li> <li>• <b>Specific:</b> If you want to filter a specific VLAN ID with this ACE, choose this value. A field for entering a VLAN ID number appears.</li> </ul>  |
| Tag Priority    | <p>Specify the tag priority for this ACE. A frame that hits this ACE matches this tag priority. The allowed number range is <b>0 to 7</b> or range <b>0-1, 2-3, 4-5, 6-7, 0-3</b> and <b>4-7</b>. The value <b>Any</b> means that no tag priority is specified (tag priority is "don't-care".)</p>                                              |

#### 4.8.2.11 ACL Status

This section shows the ACL status by different ACL users. Each row describes the [ACE](#) that is defined. It is a conflict if a specific ACE is not applied to the hardware due to hardware limitations. The maximum number of ACEs is 256 on each switch.

**Web GUI: Monitor > Security > Network > ACL Status**

#### ACL Status

**Table 4-77: ACL Status Parameters**

|      |                                       |
|------|---------------------------------------|
| User | Indicates the ACL user.               |
| ACE  | Indicates the ACE ID on local switch. |

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Frame Type   | <p>Indicates the frame type of the ACE. Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>Any:</b> The ACE will match any frame type.</li> <li>• <b>EType:</b> The ACE will match <u>Ethernet Type</u> frames. <b>Note that an Ethernet Type based ACE will not get matched by IP and <u>ARP</u> frames.</b></li> <li>• <b>ARP:</b> The ACE will match ARP/RARP frames.</li> <li>• <b>IPv4:</b> The ACE will match all IPv4 frames.</li> <li>• <b>IPv4/ICMP:</b> The ACE will match IPv4 frames with ICMP protocol.</li> <li>• <b>IPv4/UDP:</b> The ACE will match IPv4 frames with UDP protocol.</li> <li>• <b>IPv4/TCP:</b> The ACE will match IPv4 frames with TCP protocol.</li> <li>• <b>IPv4/Other:</b> The ACE will match IPv4 frames, which are not ICMP/UDP/TCP.</li> <li>• <b>IPv6:</b> The ACE will match all IPv6 standard frames.</li> </ul> |
| Action       | <p>Indicates the forwarding action of the ACE.</p> <ul style="list-style-type: none"> <li>• <b>Permit:</b> Frames matching the ACE may be forwarded and learned.</li> <li>• <b>Deny:</b> Frames matching the ACE are dropped.</li> <li>• <b>Filter:</b> Frames matching the ACE are filtered.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Rate Limiter | <p>Indicates the rate limiter number of the ACE. The allowed range is <b>1</b> to <b>16</b>. When <b>Disabled</b> is displayed, the rate limiter operation is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mirror       | <p>Specify the mirror operation of this port. Frames matching the ACE are mirrored to the destination mirror port. The allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Frames received on the port are mirrored.</li> <li>• <b>Disabled:</b> Frames received on the port are not mirrored. The default value is "Disabled".</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CPU          | <p>Forward packet that matched the specific ACE to CPU.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Counter      | <p>The counter indicates the number of times the ACE was hit by a frame.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Conflict     | <p>Indicates the hardware status of the specific ACE. The specific ACE is not applied to the hardware due to hardware limitations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 4.8.2.12 IP Source Guard Configuration

IP Source Guard is a secure feature used to restrict IP traffic on DHCP snooping untrusted ports by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host. This section provides the related IP Source Guard configurations

**Web GUI: Configuration > Security > Network > IP Source Guard/Configuration**

#### IP Source Guard Configuration

Mode

#### Port Mode Configuration

| Port | Mode       | Max Dynamic Clients |
|------|------------|---------------------|
| *    | <> v       | <> v                |
| 1    | Disabled v | Unlimited v         |
| 2    | Disabled v | Unlimited v         |
| 3    | Disabled v | Unlimited v         |
| 4    | Disabled v | Unlimited v         |
| 5    | Disabled v | Unlimited v         |
| 6    | Disabled v | Unlimited v         |
| 7    | Disabled v | Unlimited v         |
| 8    | Disabled v | Unlimited v         |
| 9    | Disabled v | Unlimited v         |
| 10   | Disabled v | Unlimited v         |
| 11   | Disabled v | Unlimited v         |
| 12   | Disabled v | Unlimited v         |

| 20   | Disabled v | Unlimited v         |
| 21   | Disabled v | Unlimited v         |

**Figure 4-82: IP Source Guard Configuration**

**Table 4-78: IP Source Guard Configuration Parameters**

|                                       |                                                                                                                                                                         |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode of IP Source Guard Configuration | Enable the Global IP Source Guard or disable the Global IP Source Guard. All configured ACEs will be lost when the mode is enabled.                                     |
| Port Mode Configuration               | Specify IP Source Guard is enabled on which ports. Only when both Global Mode and Port Mode on a given port are enabled, IP Source Guard is enabled on this given port. |

|                     |                                                                                                                                                                                                                                                                                                                |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Dynamic Clients | Specify the maximum number of dynamic clients that can be learned on given port. This value can be 0, 1, 2 or unlimited. If the port mode is enabled and the value of max dynamic client is equal to 0, it means only allow the IP packets forwarding that are matched in static entries on the specific port. |
| Buttons             | <b>Translate dynamic to static:</b> Click to translate all dynamic entries to static entries.                                                                                                                                                                                                                  |

### 4.8.2.13 Static IP Source Guard Table

Web GUI: Configuration > Security > Network > IP Source Guard/Static Table

#### Static IP Source Guard Table

| Delete | Port | VLAN ID | IP Address | MAC address |
|--------|------|---------|------------|-------------|
| Delete | 1 ▼  |         |            |             |
| Delete | 1 ▼  |         |            |             |

Add New Entry

Apply Reset

Figure 4-83: Static IP Source Guard Table

Table 4-79: IP Source Guard Table Parameters

|             |                                                                                     |
|-------------|-------------------------------------------------------------------------------------|
| Delete      | Check to delete the entry. It will be deleted during the next save.                 |
| Port        | The logical port for the settings.                                                  |
| VLAN ID     | The VLAN ID for the settings.                                                       |
| IP Address  | Allowed Source IP address                                                           |
| MAC address | Allowed Source MAC address                                                          |
| Buttons     | <b>Add New Entry:</b> Click to add a new entry to the Static IP Source Guard table. |

### 4.8.2.14 Dynamic IP Source Guard Table

Entries in the Dynamic IP Source Guard Table are shown on this page. The Dynamic IP Source Guard Table is sorted first by port, then by VLAN ID, then by IP address, and then by MAC address

#### Navigating the IP Source Guard Table

Each page shows up to 99 entries from the Dynamic IP Source Guard table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Dynamic IP Source Guard Table.

The "Start from port address", "VLAN" and "IP address" input fields allow the user to select the starting point in the Dynamic IP Source Guard Table.

Clicking the **Refresh** button will update the displayed table starting from that or the closest next Dynamic IP Source Guard Table match. In addition, the two input fields will - upon a **Refresh** button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The will >> use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

### 4.8.3 Address Resolution Protocol

ARP is an acronym for Address Resolution Protocol. It is a protocol that used to convert an IP address into a physical address, such as an Ethernet address. ARP allows a host to communicate with other hosts when only the Internet address of its neighbors is known. Before using IP, the host sends a broadcast ARP request containing the Internet address of the desired destination system.

The ARP subject is covered by the following displays:

- ARP Inspection Configuration
- Port Mode Configuration
- VLAN Mode Configuration
- Static ARP Inspection Table
- Dynamic ARP Inspection Table

#### 4.8.3.1 ARP Inspection Configuration

This section provides ARP Inspection related configuration.

ARP Inspection is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through the switch device.

| <p>Each page shows up to 9999 entries from the VLAN table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table. The "VLAN" input fields allow the user to select the starting point in the VLAN Table.</p> <p>Clicking <b>Refresh</b> the button will update the displayed table starting from that or the closest next VLAN Table match. The &gt;&gt; will use the next entry of the currently displayed VLAN entry as a basis for the next lookup. When the end is reached the warning, message is shown in the displayed table. Use the &lt;&lt; button to start over.</p> |                                                                                 |

### 4.8.3.3 Static ARP Inspection Table

This page shows the static ARP Inspection rules. The maximum number of rules is **256** on the switch.

**Web GUI: Monitor > Security > Network > ARP Inspection > Static Table**

#### Static ARP Inspection Table

| Delete | Port | VLAN ID              | MAC Address          | IP Address           |
|--------|------|----------------------|----------------------|----------------------|
| Delete | 1 ▾  | <input type="text"/> | <input type="text"/> | <input type="text"/> |

Add New Entry

Apply Reset

**Table 4-83: Static ARP Inspection Table parameters**

| Static ARP Inspection Table |                                                                    |
|-----------------------------|--------------------------------------------------------------------|
| Delete                      | Check to delete the entry. It will be deleted during the next save |
| Port                        | The logical port for the settings.                                 |
| VLAN ID                     | The VLAN ID for the settings.                                      |

|             |                                                                                    |
|-------------|------------------------------------------------------------------------------------|
| MAC Address | Allowed Source MAC address in ARP request packets                                  |
| IP Address  | Allowed Source IP address in ARP request packets                                   |
| Buttons     | <b>Add New Entry:</b> Click to add a new entry to the Static ARP Inspection table. |

### 4.8.3.4 Dynamic ARP Inspection Table

Web GUI: Monitor > Security > Network > ARP Inspection > Dynamic Table

#### Dynamic ARP Inspection Table

Start from  , VLAN  , MAC address  and IP address  with  entries per page.

| Port            | VLAN ID | MAC Address | IP Address | Translate to static |
|-----------------|---------|-------------|------------|---------------------|
| No more entries |         |             |            |                     |

Auto-refresh

Entries in the Dynamic ARP Inspection Table are shown on this page. The Dynamic ARP Inspection Table contains up to 256 entries, and is sorted first by port, then by VLAN ID, then by MAC address, and then by IP address. All dynamic entries are learning from DHCP Snooping.

| VLAN ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | VLAN-ID in which the ARP traffic is permitted.         |
| MAC Address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | User MAC address of the entry                          |
| IP Address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | User IP address of the entry.                          |
| Navigating the ARP Inspection Table                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                        |
| <p>Each page shows up to 99 entries from the Dynamic ARP Inspection table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Dynamic ARP Inspection Table. The "Start from port address", "VLAN", "MAC address" and "IP address" input fields allow the user to select the starting point in the Dynamic ARP Inspection Table. Clicking the <b>Refresh</b> button will update the displayed table starting from that or the closest next Dynamic ARP Inspection Table match. In addition, the two input fields will - upon a <b>Refresh</b> button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address. The &gt;&gt; will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table.</p> <p>Use the &lt;&lt; button to start over.</p> |                                                        |

### 4.8.4 Authentication Server Configuration (AAA)

This section allows to configure the various Authentication Servers.

#### 4.8.4.1 RADIUS Server Configuration

This section allows you to configure the RADIUS servers.

**Web GUI: Monitor > Security > AAA > Radius**

#### RADIUS Server Configuration

##### Global Configuration

|                   |                                     |         |
|-------------------|-------------------------------------|---------|
| Timeout           | <input type="text" value="5"/>      | seconds |
| Retransmit        | <input type="text" value="3"/>      | times   |
| Deadtime          | <input type="text" value="0"/>      | minutes |
| Change Secret Key | No <input type="button" value="v"/> |         |

**Figure 4-89: Radius: Server Configuration**

**Table 4-85: Radius: Server Configuration Parameters**

| <b>Global Configuration</b>                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout                                                                        | Timeout is the number of seconds, in the range 1 to 1000, to wait for a reply from a RADIUS server before retransmitting the request.                                                                                                                                                                                                                                                                                                             |
| Retransmit                                                                     | Retransmit is the number of times, in the range 1 to 1000, a RADIUS request is retransmitted to a server that is not responding. If the server has not responded after the last retransmit it is dead.                                                                                                                                                                                                                                            |
| Deadtme                                                                        | Deadtme, which can be set to a number between 0 to 1440 minutes, is the period during which the switch will not send new requests to a server that has failed to respond to a previous request. This will stop the switch from continually trying to contact a server that it has already determined as dead. Setting the Deadtme to a value greater than 0 (zero) will enable this feature, but only if more than one server has been configured |
| Change Secret Key                                                              | Specify to change the secret key or not. When "Yes" is selected for the option, you can change the secret key - up to 63 characters long - shared between the RADIUS server and the switch.                                                                                                                                                                                                                                                       |
| NAS IP Address (Attribute 4)                                                   | The IPv4 address to be used as attribute 4 in RADIUS Access-Request packets. If this field is left blank, the IP address of the outgoing interface is used.                                                                                                                                                                                                                                                                                       |
| NAS IPv6 Address (Attribute 95)                                                | The IPv6 address to be used as attribute 95 in RADIUS Access-Request packets. If this field is left blank, the IP address of the outgoing interface is used.                                                                                                                                                                                                                                                                                      |
| NAS Identifier (Attribute32)                                                   | The identifier - up to 253 characters long - to be used as attribute 32 in RADIUS Access-Request packets. If this field is left blank, the IP address of the outgoing interface is used.                                                                                                                                                                                                                                                          |
| <b>Server Configuration</b>                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| The table has one row for each RADIUS Server and several columns listed below. |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Delete                                                                         | To delete a RADIUS server entry, check this box. The entry will be deleted during the next Save.                                                                                                                                                                                                                                                                                                                                                  |
| Hostname                                                                       | The IP address or hostname of the RADIUS server.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Auth Port                                                                      | The UDP port to use on the RADIUS server for authentication. Set to 0 to disable authentication.                                                                                                                                                                                                                                                                                                                                                  |
| Acct Port                                                                      | The UDP port to use on the RADIUS server for accounting. Set to 0 to disable accounting.                                                                                                                                                                                                                                                                                                                                                          |
| Timeout                                                                        | This optional setting overrides the global timeout value. Leaving it blank will use the global timeout value.                                                                                                                                                                                                                                                                                                                                     |
| Retransmit                                                                     | This optional setting overrides the global retransmit value. Leaving it blank will use the global retransmit value.                                                                                                                                                                                                                                                                                                                               |
| Change Secret Key                                                              | Specify to change the secret key or not. When the checkbox is checked, you can change the setting overrides the global key. Leaving it blank will use the global key.                                                                                                                                                                                                                                                                             |

| Adding a New Server                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Click <b>Add New Server</b> to add a new RADIUS server. An empty row is added to the table, and the RADIUS server can be configured as needed. Up to 5 servers are supported. |
| The <b>Delete</b> button can be used to undo the addition of the new server.                                                                                                  |

#### 4.8.4.2 Radius Server Status Overview

This page provides an overview of the status of the RADIUS servers configurable on the Global and Server configurations

**Web GUI: Monitor > Security > AAA > RADIUS Overview**

#### RADIUS Server Status Overview

| # | IP Address | Authentication Port | Authentication Status | Accounting Port | Accounting Status |
|---|------------|---------------------|-----------------------|-----------------|-------------------|
| 1 |            |                     | Disabled              |                 | Disabled          |
| 2 |            |                     | Disabled              |                 | Disabled          |
| 3 |            |                     | Disabled              |                 | Disabled          |
| 4 |            |                     | Disabled              |                 | Disabled          |
| 5 |            |                     | Disabled              |                 | Disabled          |

Click to navigate to detailed statistics for this server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| IP Address            | The IP address of the server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Authentication Port   | UDP port number for authentication                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Authentication Status | <p>The current status of the server. This field takes one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> The server is disabled.</li> <li>• <b>Not Ready:</b> The server is enabled, but IP communication is not yet up and running.</li> <li>• <b>Ready:</b> The server is enabled, IP communication is up and running, and the RADIUS module is ready to accept access attempts.</li> <li>• <b>Dead (X seconds left):</b> Access attempts were made to this server, but it did not reply within the configured timeout. The server has temporarily been disabled but will get re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled.</li> </ul> |
| Accounting Port       | UDP port for accounting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Accounting Status     | <p>The status of the server. This field takes one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> The server is disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

- **Not Ready:** The server is enabled, but IP communication is not yet up and running.
- **Ready:** The server is enabled, IP communication is up and running, and the RADIUS module is ready to accept access attempts.
- **Dead (X seconds left):** Access attempts were made to this server, but it did not reply within the configured timeout. The server has temporarily been disabled but will get re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled.

#### 4.8.4.3 TACACS+ Sever Configuration

This page allows you to configure the TACACS+ servers.

TACACS+ is an acronym for **T**erminal **A**ccess **C**ontroller **A**ccess **C**ontrol **S**ystem **P**lus. It is a networking protocol which provides access control for routers, network access servers and other networked computing devices via one or more centralized servers. TACACS+ provides separate authentication, authorization and accounting services.

**Web GUI: Monitor > Security > AAA > TACACA+**

#### TACACS+ Server Configuration

##### Global Configuration

|                   |                             |         |
|-------------------|-----------------------------|---------|
| Timeout           | 5                           | seconds |
| Deadtime          | 0                           | minutes |
| Change Secret Key | No <input type="checkbox"/> |         |

##### Server Configuration

| Delete | Hostname | Port | Timeout | Change Secret Key |
|--------|----------|------|---------|-------------------|
| Delete |          | 49   |         |                   |

Add New Server

**Figure 4-91: TACACS+ Server Configuration**

**Table 4-87: TACACS+ Server Configuration Parameters**

| Global Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout              | Timeout is the number of seconds, in the range 1 to 1000, to wait for a reply from a TACACS+ server before it is dead.                                                                                                                                                                                                                                                                                                                                            |
| Deadtime             | <p>Deadtime, which can be set to a number between 0 to 1440 minutes, is the period during which the switch will not send new requests to a server that has failed to respond to a previous request. This will stop the switch from continually trying to contact a server that it has already determined as dead.</p> <p>Setting the Deadtime to a value greater than 0 (zero) will enable this feature, but only if more than one server has been configured</p> |

|                                                                                                                                                                                 |                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Change Secret Key                                                                                                                                                               | Specify to change the secret key or not. When <b>Yes</b> is selected for the option, you can change the secret key - up to 63 characters long - shared between the TACACS+ server and the switch. |
| <b>Server Configuration</b>                                                                                                                                                     |                                                                                                                                                                                                   |
| The table has one row for each TACACS+ Server and several columns listed below.                                                                                                 |                                                                                                                                                                                                   |
| Delete                                                                                                                                                                          | To delete a TACACS+ server entry, check this box.<br>The entry will be deleted during the next Save.                                                                                              |
| Hostname                                                                                                                                                                        | The IP address or hostname of the TACACS+ server.                                                                                                                                                 |
| Port                                                                                                                                                                            | The UDP port to use on the TACACS+ server for authentication.                                                                                                                                     |
| Timeout                                                                                                                                                                         | This optional setting overrides the global timeout value.<br>Leaving it blank will use the global timeout value.                                                                                  |
| Change Secret Key                                                                                                                                                               | Specify to change the secret key or not. When the checkbox is checked, you can change the setting overrides the global key. Leaving it blank will use the global key.                             |
| <b>Adding a New Server</b>                                                                                                                                                      |                                                                                                                                                                                                   |
| Click <b>Add New Server</b> to add a new TACACS+ server. An empty row is added to the table, and the TACACS+ server can be configured as needed. Up to 5 servers are supported. |                                                                                                                                                                                                   |
| The <b>Delete</b> button can be used to undo the addition of the new server                                                                                                     |                                                                                                                                                                                                   |

### 1.1.1.1 RADIUS Auth.Statistics for Server

This section provides detailed statistics for a particular RADIUS server.

The statistics map closely to those specified in RFC4668 - RADIUS Authentication Client MIB.

Use the server select box to switch between the backend servers to show details for.

Web GUI: Monitor > Security > AAA > Radius Overview

Malformed packets include packets with an invalid length. Bad authenticators or Message Authenticator attributes or unknown types are not included as malformed access responses. |

|    |                        |                                          |                                                                                                                                                                                                                                                                                                              |
|----|------------------------|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx | Bad Authenticators     | radiusAuthClientExtBadAuthenticators     | The number of RADIUS Access-Response packets containing invalid authenticators or Message Authenticator attributes received from the server.                                                                                                                                                                 |
| Rx | Unknown Types          | radiusAuthClientExtUnknownTypes          | The number of RADIUS packets that were received with unknown types from the server on the authentication port and dropped.                                                                                                                                                                                   |
| Rx | Packets Dropped        | radiusAuthClientExtPacketsDropped        | The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.                                                                                                                                                                                |
| Tx | Access Requests        | radiusAuthClientExtAccessRequests        | The number of RADIUS Access-Request packets sent to the server. This does not include retransmissions.                                                                                                                                                                                                       |
| Tx | Access Retransmissions | radiusAuthClientExtAccessRetransmissions | The number of RADIUS Access-Request packets retransmitted to the RADIUS authentication server.                                                                                                                                                                                                               |
| Tx | Pending Requests       | radiusAuthClientExtPendingRequests       | The number of RADIUS Access-Request packets destined for the server that have not yet timed out or received a response. This variable is incremented when an Access-Request is sent and decremented due to receipt of an Access-Accept, Access-Reject, Access-Challenge, timeout, or retransmission.         |
| Tx | Timeouts               | radiusAuthClientExtTimeouts              | The number of authentication timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout |

| Other Info |              | This section contains information about the state of the server and the latest round-trip time.                                                                                                                                                                                                                                                             |

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                  | <b>Dead (X seconds left):</b> Access attempts were made to this server, but it did not reply within the configured timeout. The server has temporarily been disabled but will get re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled. |
| Round-Trip Time                                                                                                                                                                  | Rad+iusAuthClientExtRoundTripTime<br>The time interval (measured in milliseconds) between the most recent Access-Reply/Access-Challenge and the Access-Request that matched it from the RADIUS authentication server. The granularity of this measurement is 100 ms. A value of 0 ms indicates that there has not been round-trip communication with the server yet.   |
| <b>RADIUS Accounting Statistics</b>                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                        |
| The statistics map closely to those specified in RFC4670 - RADIUS Accounting Client MIB.<br>Use the server select box to switch between the backend servers to show details for. |                                                                                                                                                                                                                                                                                                                                                                        |
| Packet Counters                                                                                                                                                                  | RADIUS accounting server packet counter. There are five receive and four transmit counters                                                                                                                                                                                                                                                                             |

| Direction | Name                | RFC4670 Name                         | Description                                                                                                                                                                                                    |
|-----------|---------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx        | Responses           | radiusAccClientExtResponses          | The number of RADIUS packets (valid or invalid) received from the server.                                                                                                                                      |
| Rx        | Malformed Responses | radiusAccClientExtMalformedResponses | The number of malformed RADIUS packets received from the server. Malformed packets include packets with an invalid length. Bad authenticators or unknown types are not included as malformed access responses. |
| Rx        | Bad Authenticators  | radiusAcctClientExtBadAuthenticators | The number of RADIUS packets containing invalid authenticators received from the server.                                                                                                                       |
| Rx        | Unknown Types       | radiusAccClientExtUnknownTypes       | The number of RADIUS packets of unknown types that were received from the server on the accounting port.                                                                                                       |
| Rx        | Packets Dropped     | radiusAccClientExtPacketsDropped     | The number of RADIUS packets that were received from the server on the accounting port and dropped for some other reason.                                                                                      |
| Tx        | Requests            | radiusAccClientExtRequests           | The number of RADIUS packets sent to the server. This does not include retransmissions.                                                                                                                        |
| Tx        | Retransmissions     | radiusAccClientExtRetransmissions    | The number of RADIUS packets retransmitted to the RADIUS accounting server.                                                                                                                                    |
| Tx        | Pending Requests    | radiusAccClientExtPendingRequests    | The number of RADIUS packets destined for the server that have not yet timed out or received a response. This variable is incremented when a                                                                   |

|    |          |                            |                                                                                                                                                                                                                                                                                                           |
|----|----------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |          |                            | Request is sent and decremented due to receipt of a Response, timeout, or retransmission.                                                                                                                                                                                                                 |
| Tx | Timeouts | radiusAccClientExtTimeouts | The number of accounting timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout. |

| IP Address      | -                               | IP address and UDP port for the accounting server in question.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |
| State           | -                               | Shows the state of the server. It takes one of the following values:<br><b>Disabled:</b> The selected server is disabled.<br><b>Not Ready:</b> The server is enabled, but IP communication is not yet up and running.<br><b>Ready:</b> The server is enabled, IP communication is up and running, and the RADIUS module is ready to accept accounting attempts.<br><b>Dead (X seconds left):</b> Accounting attempts were made to this server, but it did not reply within the configured timeout. The server has temporarily been disabled but will get re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled. |  |
| Round-Trip Time | radiusAccClientExtRoundTripTime | The time interval (measured in milliseconds) between the most recent Response and the Request that matched it from the RADIUS accounting server. The granularity of this measurement is 100 ms. A value of 0 ms indicates that there has not been round-trip communication with the server yet.                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |

## 4.9 SyncCenter Configuration

### 4.9.1 Overview

SyncCenter is a unique feature developed by Fibrolan, which clearly visualizes the system’s clocks and timing flows. It allows the high-level configuration and monitoring of inputs, outputs and behavior.

Each one of the different inputs and outputs (e.g. PTP, SyncE) is configured and monitored in their own respective detailed pages, but the overall control and relationship between them is handled by SyncCenter.

Furthermore, SyncCenter allows both General and Hybrid modes. In General mode all clocking domains (frequency, phase and ToD) are control by the same input(s) (e.g. GNSS), while the Hybrid mode allows each domain to operate independently of the others (e.g. as a BC, with both PTP and SyncE).

### 4.9.2 Mode Configuration

This section enables the configuration of the device's clocking system, with sync reference sources, outputs and overall state.

The possible clock reference inputs (sync source) to the SyncCenter are: SyncE, PTP, NTP, GNSS, ToD, TDM and External (1PPS and 10MHz). The SyncCenter will output the required sync clock according to reference quality and priority.

**Web GUI: Configuration > Timing > SyncCenter**

**Figure 4-93: Mode selection**

When SyncCenter mode is set to Hybrid split clocking domain option appears

### 4.9.3 Sync Source Configuration

| Sync Source |     |      |      |        |         |           |
|-------------|-----|------|------|--------|---------|-----------|
| ID          | Ena | Type | Port | Status | Quality |           |
|             |     |      |      |        | Current | Qualified |
|             |     |      |      |        |         |           |

**Figure 4-94: Sync Source display**

Up to 5 different Sync sources cab be configured including SyncE, PTP, NTP, GNSS, ToD, TDM and External. Source priority can be set according to ID (default) of quality level.

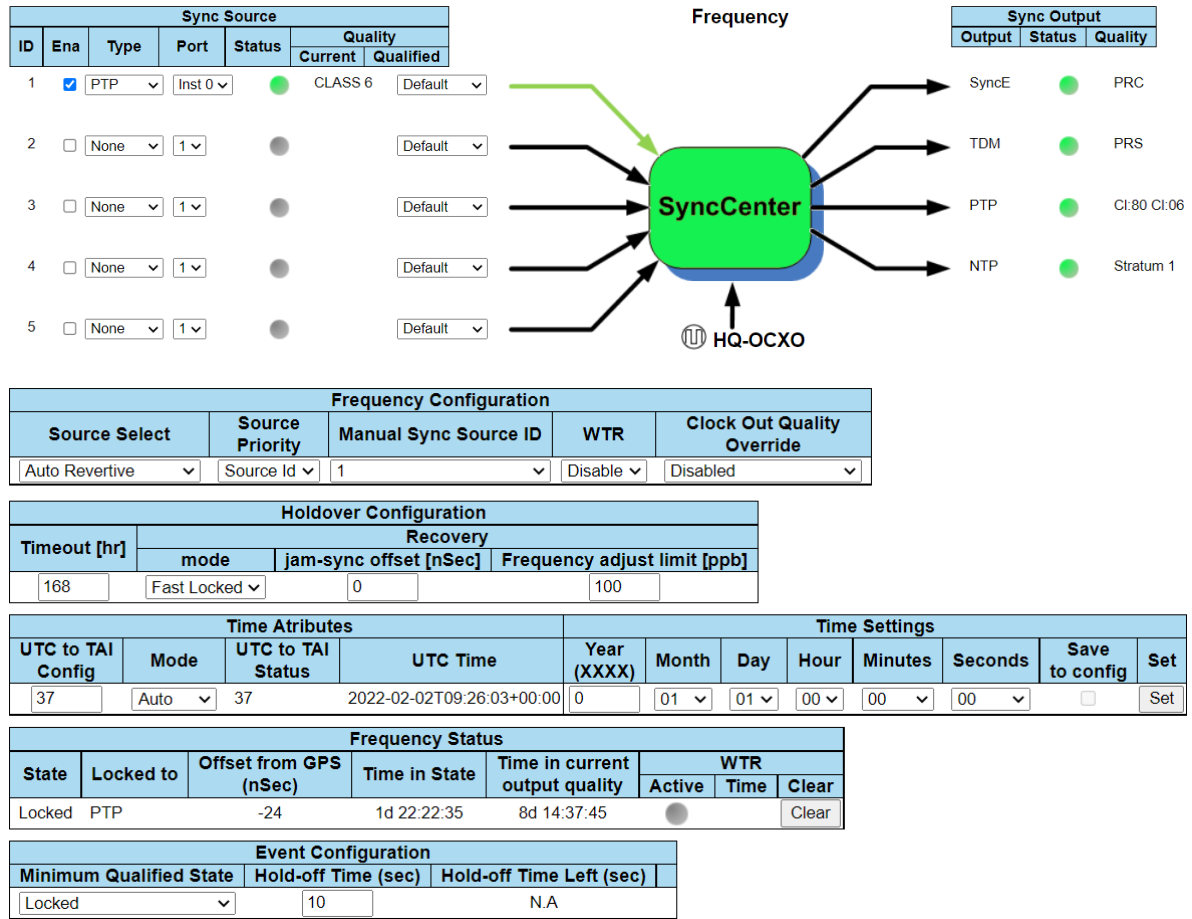

Figure 4-95: SyncCenter configuration page

Table 4-89: Sync Source parameters

| Sync Source         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                  | Indicates the sync source identification number.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Ena                 | Enable or disable the sync source.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Type                | Select the type of sync source. Available options depend on model and may include: SyncE, PTP, GNSS, TDM and External.                                                                                                                                                                                                                                                                                                                                           |
| Port                | Select the port or instance of the selected sync source type. For example: for SyncE this will be Ethernet port numbers, for PTP the clock instance number, etc.                                                                                                                                                                                                                                                                                                 |
| State               | The status of the sync source. This indicator displays the following states: <ul style="list-style-type: none"> <li><b>Green</b> - The source provides a valid reference clock.</li> <li><b>Red</b> – indicates failure of the source.</li> <li><b>Orange</b> – Source quality is unqualified</li> <li><b>Grey</b> - When a source is disabled or not applicable, indicator will be.</li> </ul> The indicator is also a hyperlink to the detailed source’s page. |
| Quality (Current)   | Indicates the sync source’s current (clock) quality (QL) as received from the source (e.g., via SSM). When there is no quality indication received from the source, a default quality value is shown with parentheses.                                                                                                                                                                                                                                           |
| Quality (Qualified) | select the threshold quality, for which the source will be qualified as valid.                                                                                                                                                                                                                                                                                                                                                                                   |

### 4.9.4 SyncCenter Visual Indicators

**Table 4-90: Sync Center parameters**

| SyncCenter    |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Input arrows  | Visualization of sources feeding the system. A <b>green</b> arrow indicates the source is currently selected.                                                                                                                                                                                                                                                                                                                                   |
| SyncCenter    | Provides a visual indication of the current system clock status: <ul style="list-style-type: none"> <li>• <b>Green</b> - system is locked to a sync source.</li> <li>• <b>Blue</b> - indicates the system is in Holdover state.</li> <li>• <b>Yellow</b> - indicates Free running (internal clock) state.</li> <li>• <b>Green/Yellow</b> (blinking) - Lock Acquisition.</li> <li>• <b>Blue/Green</b> (blinking) - Holdover Recovery.</li> </ul> |
| Output arrows | Visualization of outputs (distributed from the system clock).                                                                                                                                                                                                                                                                                                                                                                                   |

### 4.9.5 Sync Output

| Sync Output |        |         |
|-------------|--------|---------|
| Output      | Status | Quality |

**Figure 4-96: Sync Output**

**Table 4-91: Sync Output parameters**

| Sync Output |                                                                 |
|-------------|-----------------------------------------------------------------|
| Output      | Indicates the type of output (e.g., SyncE, PTP, BITS, etc.).    |
| Status      | Indicates the clock output is active                            |
| Quality     | Indicates the clock quality distributed on this type of output. |

### 4.9.6 Source Select Configuration

| Frequency Configuration |                 |                       |           |
|-------------------------|-----------------|-----------------------|-----------|
| Source Select           | Source Priority | Manual Sync Source ID | WTR       |
| Auto Revertive ▾        | Source Id ▾     | 1 ▾                   | Disable ▾ |
| Manual                  |                 |                       |           |
| Auto Non-Revertive      |                 |                       |           |
| <b>Auto Revertive</b>   |                 |                       |           |
| Forced Holdover         |                 |                       |           |
| Forced Free-running     |                 |                       |           |

**Figure 4-97: SyncCenter Configuration**

**Table 4-92: Configuration parameters**

| General/Frequency/Phase/ToD Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                                      | <p>Allow selection of the required system’s synchronization mode<br/>Available modes are:</p> <ul style="list-style-type: none"> <li>• <b>Manual:</b> source will be the one configured in the manual source configuration fields, regardless of its state.</li> <li>• <b>Auto Revertive (default mode):</b> clock source is automatically selected based on priority and state. When higher priority source that previously failed, is valid again, switchover will take place. This is the default mode and the most commonly used one.</li> <li>• <b>Auto Non-Revertive:</b> clock source is automatically selected based on priority and state. When higher priority source that previously failed, is valid again, no switchover will take place.</li> <li>• <b>Forced HoldOver:</b> the system will be synchronized to the last selected source but will go into holdover mode and ignore this source.</li> <li>• <b>Forced Free running:</b> the system will be synchronized to the local clock, ignoring all sync sources.</li> </ul> |
| Priority Select Mode                      | The source will be selected based on its ID (the lower it is the higher its priority) or based on its Quality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Manual Sync Source ID                     | Manually configure the sync source. Applicable only in Manual mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| WTR                                       | Configure the Wait To Restore (WTR) timer or disable its operation (applicable when in Auto-Revertive mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 4.9.7 Holdover Configuration

| Holdover Configuration |          |               |                        |                              |
|------------------------|----------|---------------|------------------------|------------------------------|
| Timeouts [min]         |          | Recovery      |                        |                              |
| Out of spec            | Free run | mode          | jam-sync offset [nSec] | Frequency adjust limit [ppb] |
| 43200                  | 43200    | Fast Locked ▾ | 0                      | 100                          |

**Figure 4-98: Holdover Configuration**

**Table 4-93: Holdover Configuration parameters**

| Holdover Configuration   |                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout [min]            | Set the SyncCenter holdover duration in minutes for available states: <ul style="list-style-type: none"> <li>In-spec timer, when expired system mode changes to Out-of-spec</li> <li>Out-of-spec timer, when expired system mode changes to Free-running</li> </ul> |
| Mode                     | Three options supported: Fast Locked, Keep offset, Freq adjust.                                                                                                                                                                                                     |
| jam-sync offset          | Default setting is 0                                                                                                                                                                                                                                                |
| Frequency adjust limit [ | Default setting is 100 ppb                                                                                                                                                                                                                                          |

### 4.9.8 Time Attributes Configuration

| Time Attributes   |      |                   |                           |
|-------------------|------|-------------------|---------------------------|
| UTC to TAI Config | Mode | UTC to TAI Status | UTC Time                  |
| 37                | Auto | 37                | 2022-04-05T05:16:10+00:00 |

**Figure 4-99: Time Attributes Configuration**

**Table 4-94: Time Attributes Configuration parameters**

| Holdover Configuration |                                                    |
|------------------------|----------------------------------------------------|
| UTC to TAI             | Value in seconds of difference between UTC and TAI |
| Mode                   | Options supported: Manual, Auto.                   |
| UTC Time               | Display the current UTC time of the SyncCenter     |

### 4.9.9 Time Settings Configuration

| Time Settings |       |     |      |         |         |                          |     |
|---------------|-------|-----|------|---------|---------|--------------------------|-----|
| Year (XXXX)   | Month | Day | Hour | Minutes | Seconds | Save to config           | Set |
| 0             | 01    | 01  | 00   | 00      | 00      | <input type="checkbox"/> | Set |

**Figure 4-100: Time Settings Configuration**

**Table 4-95: Time Settings Configuration parameters**

| Holdover Configuration |                                                                                                                                     |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Time Settings          | Allows to set the system date and time manually                                                                                     |
| Save to config         | Option to save the manual settings to running configuration file                                                                    |
| Set                    | Set the selected date and time values. This will not Apply nor Save the values to configuration. These actions are done separately. |

### 4.9.10 SyncCenter General/Frequency/Phase/ToD Status

| General Status |           |                        |               |                                |        |      |       |
|----------------|-----------|------------------------|---------------|--------------------------------|--------|------|-------|
| State          | Locked to | Offset from GPS (nSec) | Time in State | Time in current output quality | WTR    |      |       |
|                |           |                        |               |                                | Active | Time | Clear |
| Locked         | GPS       | 0                      | 24d 14:37:11  | 24d 14:40:34                   |        |      | Clear |

Figure 4-101: SyncCenter Status

Table 4-96: SyncCenter Status parameters

| SyncCenter Status              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State                          | Shows the current SyncCenter state, which includes: <ul style="list-style-type: none"> <li>• <b>Free Run</b> - indicates Free running (internal clock) state.</li> <li>• <b>Lock Acquisition</b> - indicates the system locking on selected reference.</li> <li>• <b>Locked</b> – indicates the system locked to selected reference.</li> <li>• <b>Holdover</b> - reference was lost, system is maintaining clocked output.</li> <li>• <b>Holdover Recovery</b> - reference rediscovered, system resyncs.</li> </ul> |
| Locked to                      | Indicates the sync source (type and port/instance) the system is currently locked to (e.g., PTP, GPS, etc.).                                                                                                                                                                                                                                                                                                                                                                                                         |
| Offset from GNSS (nSec)        | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Time in State                  | The time that has passed since the last system sync state change.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Time in current output quality | The time that has passed since the last output QL change.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| WTR Active                     | Indicates the current active status of the WTR timer. <b>Green</b> means timer is not running (i.e., system stable), <b>Amber</b> means timer is currently running, and <b>Grey</b> indicates WTR is disabled.                                                                                                                                                                                                                                                                                                       |
| WTR Time                       | Indicates the time left before the WTR timer expires (when running).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Clear button                   | Allows resetting of the WTR timer when running (i.e., skip the WTR period).                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Buttons                        | <b>Monitor</b> Direct link to the Sync Center monitoring page.<br><b>Other Buttons:</b> Direct link to relevant pages.                                                                                                                                                                                                                                                                                                                                                                                               |

## 4.10 SyncCenter Monitoring

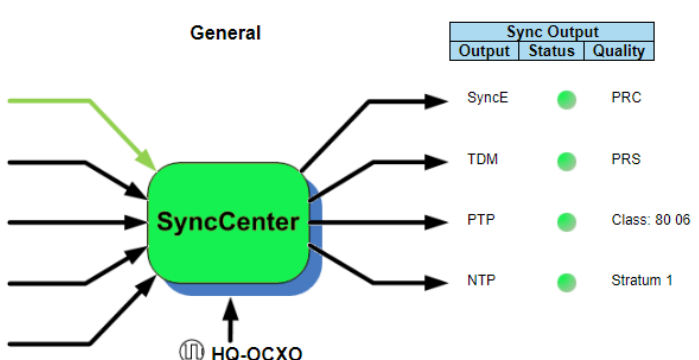

This page allows us to monitor and view the status of the SyncCenter. The page automatically update in order to display the actual status.

**Web GUI: Monitor > Timing > SyncCenter > Status**

**SyncCenter Status**

Mode **General**

| Sync Source |                                     |      |        |                                      |         |           |
|-------------|-------------------------------------|------|--------|--------------------------------------|---------|-----------|
| ID          | Ena                                 | Type | Port   | Status                               | Quality |           |
|             |                                     |      |        |                                      | Current | Qualified |
| 1           | <input checked="" type="checkbox"/> | PTP  | Inst 0 | <span style="color: green;">●</span> | CLASS 6 | Default   |
| 2           | <input type="checkbox"/>            | None |        | <span style="color: gray;">●</span>  |         | Default   |
| 3           | <input type="checkbox"/>            | None |        | <span style="color: gray;">●</span>  |         | Default   |
| 4           | <input type="checkbox"/>            | None |        | <span style="color: gray;">●</span>  |         | Default   |
| 5           | <input type="checkbox"/>            | None |        | <span style="color: gray;">●</span>  |         | Default   |

| Sync Output |                                      |              |
|-------------|--------------------------------------|--------------|
| Output      | Status                               | Quality      |
| SyncE       | <span style="color: green;">●</span> | PRC          |
| TDM         | <span style="color: green;">●</span> | PRS          |
| PTP         | <span style="color: green;">●</span> | Class: 80 06 |
| NTP         | <span style="color: green;">●</span> | Stratum 1    |

| General Configuration |                 |                       |
|-----------------------|-----------------|-----------------------|
| Source Select         | Source Priority | Manual Sync Source ID |
| Auto Revertive        | Source Id       | 1                     |

| SyncCenter General Status |           |                        |               |                                |                                     |      |
|---------------------------|-----------|------------------------|---------------|--------------------------------|-------------------------------------|------|
| State                     | Locked to | Offset from GPS (nSec) | Time in State | Time in current output quality | WTR                                 |      |
|                           |           |                        |               |                                | Active                              | Time |
| Locked                    | PTP       | N.A                    | 0d 01:06:38   | 0d 04:03:38                    | <span style="color: gray;">●</span> | 0    |

| Time              |      |                   |                           |
|-------------------|------|-------------------|---------------------------|

| 37                | 1    | 37                | 2022-04-17T20:02:31+02:00 |

| Event Configuration and Status |                     |                          |  |
|--------------------------------|---------------------|--------------------------|--|
| Minimum Qualified State        | Hold-off Time (sec) | Hold-off Time Left (sec) |  |
| Locked                         | 10                  | N.A                      |  |

Configuration **Statistics**

**Figure 4-102: Monitoring SyncCenter Status displays**

The following displays allow us to monitor the SyncCenter status and activity.

### 4.10.1 Sync Sources and Visual Indicators

For details refer to Table 4-89 and Table 4-90

### 4.10.2 SyncCenter Source Status

The status table display the current state of the system in reference to the selected Timing source.

**Figure 4-103: General Status**

| SyncCenter General Status |           |                        |               |                                |                                     |      |
|---------------------------|-----------|------------------------|---------------|--------------------------------|-------------------------------------|------|
| State                     | Locked to | Offset from GPS (nSec) | Time in State | Time in current output quality | WTR                                 |      |
|                           |           |                        |               |                                | Active                              | Time |
| Locked                    | PTP       | N.A                    | 0d 12:27:02   | 0d 15:24:02                    | <span style="color: gray;">●</span> | 0    |

**Table 4-97: General Status parameters**

|                                |                                                                                                                                                                                                        |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State                          | Shows the current system's overall synchronization state (e.g., Locked). The state is also evident in the color of the SyncCenter main block diagram as described in Table 4-90 and Table 4-96         |
| Locked to                      | Indicates the sync source (type and port/instance) the system is currently locked to (e.g., SyncE 2).                                                                                                  |
| Offset from GNSS (nSec)        | Currently N/A.                                                                                                                                                                                         |
| Time in State                  | The time that has passed since the last system sync state change.                                                                                                                                      |
| Time in current output quality | The time that has passed since the last output QL change.                                                                                                                                              |
| WTR Active                     | Indicates the active status of the WTR timer. <b>Green</b> means timer is not running (i.e., system stable), <b>Amber</b> means timer is currently running, and <b>Grey</b> indicates WTR is disabled. |
| WTR Time                       | Indicates the time left before the WTR timer expires (when running).                                                                                                                                   |
| Clear button                   | Allows resetting of the WTR timer when running (i.e., skip the WTR period).                                                                                                                            |

### 4.10.3 Time

| Time              |                           |
|-------------------|---------------------------|
| UTC to TAI Status | UTC Time                  |
| 37                | 2021-04-09T13:07:44+00:00 |

|                   |                                                    |
|-------------------|----------------------------------------------------|
| UTC to TAI Status | Value in seconds of difference between UTC and TAI |
| UTC Time          | Display the current UTC time of the SyncCenter     |

## 4.11 GNSS Receiver

This section shows the various GNSS displays and their functionality receiver GNSS Configuration. This section displays the configuration and status info of the GNSS receiver.

### 4.11.1 GNSS Antenna Cable Configuration

Web GUI: Configuration > Timing > GNSS

#### GNSS Configuration

| Status                                                                                   | Date       | Time (UTC) | Latitude (°) | Longitude (°) | Altitude (m) |
|------------------------------------------------------------------------------------------|------------|------------|--------------|---------------|--------------|
| Locked  | 19.05.2022 | 10:30:21   | 52°12'       | 20°59'        | 158.19       |

#### GNSS Alarms

| Comm                                                                              | Ant Open                                                                          | Ant Shorted                                                                       | No Satellites                                                                     | PPS Not Gen                                                                         |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|  |  |  |  |  |

#### GNSS Antenna Cable Configuration

| Type                               | Velocity Factor | Length | Calculated Delay | Manual Delay | Description |
|------------------------------------|-----------------|--------|------------------|--------------|-------------|
| RG6 <input type="text" value="v"/> | 0.75            | 30 m   | 133 ns           | 0 ns         |             |

Calculate Delay

#### GNSS Masks

| Elevation                         |
|-----------------------------------|
| 0° <input type="text" value="v"/> |

Figure 4-105: GNSS Configuration

Table 4-99: GNSS Antenna Cable Configuration parameters

|                  |                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Type             | Set the type of cable being used for the GNSS antenna. When Manual is selected, it is possible to directly configure the cable delay. |
| Velocity Factor  | Set the Velocity Factor (VF) of the antenna cable.                                                                                    |
| Length           | Set the length of the antenna cable in meters.                                                                                        |
| Calculated Delay | Indicates the cable delay in nsec as calculated based on VF and length.                                                               |
| Manual Delay     | Set the cable delay in nsec manually (applicable when Type is <b>Manual</b> ).                                                        |
| Description      | Set a free text description of the cable (up to 63 characters).                                                                       |
| Buttons          | <b>Calculate Delay:</b> Click to calculate the cable delay based on current parameters.                                               |

### 4.11.2 GNSS Status and Alarms

This section displays the status and Alarms of the GNSS receiver.

**Web GUI: Monitor > Timing > GNSS > Status**

**GNSS Status**

| Status     | State        | Time In State | Time (UTC)      |          | Coordinates |           |          | Offsets   |          |
|------------|--------------|---------------|-----------------|----------|-------------|-----------|----------|-----------|----------|
|            |              |               | Date            | Hour     | Latitude    | Longitude | Altitude | 1PPS      | Clock    |
|            | Locked       | 0d 07:46:58   | 19.05.2022      | 13:40:27 | 52°12'59"   | 20°59'15" | 158.19m  | -2.37nsec | -1.21ppb |
| UTC Offset | Time of week | Week number   | Survey progress | Leap Sec |             |           |          |           |          |
| 18sec      | 394845sec    | 2210          | 100%            | 0sec     |             |           |          |           |          |

**GNSS Alarms**

| Comm | Ant Open | Ant Shorted | No Satellites | PPS Not Gen |
|------|----------|-------------|---------------|-------------|
|      |          |             |               |             |

**Figure 4-106: Monitoring GNSS Status and Alarms**

**Table 4-100: GNSS Status parameters**

| GNSS Status     |                                                                                  |
|-----------------|----------------------------------------------------------------------------------|
| Status          | Indicates the overall status of the GNSS receiver (e.g., Doing Fixes).           |
| Date            | Indicates the current date as received by the GNSS.                              |
| Time            | Indicates the current time of day as received by the GNSS.                       |
| Latitude        | Indicates the current latitude as received by the GNSS in degrees.               |
| Longitude       | Indicates the current longitude as received by the GNSS in degrees.              |
| Altitude        | Indicates the current altitude as received by the GNSS in meters.                |
| Offsets-1PPS    | Indicates the current estimated 1PPS time error the GNSS is generating, in nsec. |
| Offsets-Clock   | Indicates the current estimated frequency error the GNSS is generating, in ppb.  |
| UTC Offset      | Indicates the time offset from UTC time in seconds                               |
| Time of week    | Indicates the current week time in seconds (passed seconds since 1970-01-01)     |
| Week number     | Indicates the current week number (passed weeks since 1970-01-01)                |
| Survey progress | Indicates the GNSS receiver satellite survey progress in %                       |
| Leap Sec        | Indicates is if Leap Second event is expected                                    |

**Table 4-101: GNSS Alarm parameters**

| GNSS Alarms   |                                                                                  |
|---------------|----------------------------------------------------------------------------------|
| Comm          | Display status of communication with built-in GNSS receiver                      |
| Ant Open      | Signal weather the GNSS antenna is detected (green) by the receiver or not (red) |
| Ant Shorted   | Signal weather a short circuit is detected (red) by the receiver or not (green)  |
| No Satellites | When it lights red the GNSS can see no satellites.                               |
| PPS Not Gen   | When it lights red the GNSS cannot generate 1PPS signal.                         |

### 4.11.3 Satellite Status

Satellite Status Summary

| Satellite PRN | Type    | Signal Level [dB-Hz] |
|---------------|---------|----------------------|
| 32            | GPS     | 45                   |
| 23            | GPS     | 41                   |
| 26            | GPS     | 37                   |
| 22            | GPS     | 36                   |
| 16            | GPS     | 43                   |
| 21            | GPS     | 39                   |
| 10            | GPS     | 46                   |
| 27            | GPS     | 46                   |
| 18            | GPS     | 32                   |
| 8             | GPS     | 38                   |
| 81            | GLONASS | 37                   |
| 82            | GLONASS | 42                   |
| 68            | GLONASS | 41                   |
| 67            | GLONASS | 43                   |
| 66            | GLONASS | 38                   |
| 69            | GLONASS | 39                   |

|               |                                                                                     |    |
|---------------|-------------------------------------------------------------------------------------|----|
| Total visible |  | 16 |
| Total good    |  | 6  |

Figure 4-107: Satellite Status

Table 4-102: Satellite Status parameters

|                        |                                                                                                                                                                                                          |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Satellite PNR          | The PRN (satellite number) of the tracked satellites.                                                                                                                                                    |
| Type                   | Cons                                                                                                                                                                                                     |
| Signal Level           | The satellite's received signal level in terms of Carrier to Noise ratio [dB-Hz]. The accompanying LED indicates whether the satellite receive level is good ( <b>green</b> ) or fair ( <b>orange</b> ). |
| Summary Table          | Shows the number of total tracked satellites and good satellites.                                                                                                                                        |
| Details/Summary Button | Toggle detailed satellite table on/off                                                                                                                                                                   |

### 4.11.4 GNSS Antenna Cable Status

#### GNSS Antenna Cable Status

| Type | Length | Delay | Description |
|------|--------|-------|-------------|
| RG6  | 30     | 133   |             |

Figure 4-108: GNSS Antenna Cable Status

Table 4-103: GNSS Antenna Cable parameters

|                 |                                                                             |
|-----------------|-----------------------------------------------------------------------------|
| Type            | The type of cable being used for the GNSS antenna.                          |
| Length          | The length of the antenna cable in meters.                                  |
| Delay           | Indicates the cable delay in nsec.                                          |
| Description     | A textual description of the cable.                                         |
| Common Buttons: | GNSS Config. Sky View. Sat Counts are direct links to the respective pages. |

### 4.11.5 GNSS Receiver Info

#### GNSS Receiver Info

| FW          | Version | Date       |
|-------------|---------|------------|
| Application | 1.08    | 2021.05.26 |
| Core        | 3.86    | 2021.05.05 |

| HW ID       | HW Code | Serial Number | Build Time      |
|-------------|---------|---------------|-----------------|
| ICM SMT 360 | 3026    | 1382109030    | 2018.08.14:1700 |

Figure 4-110: GNSS Antenna Cable Status

Table 4-104: GNSS Antenna Cable parameters

|               |                                                  |
|---------------|--------------------------------------------------|
| FW            | Display GNSS module’s FW type: Application, Core |
| Version       | Display GNSS module’s FW versions                |
| Date          | Display GNSS module’s FW date                    |
| HW ID         | Display GNSS module’s HW ID                      |
| HW Code       | Display GNSS module’s HW Code                    |
| Serial Number | Display GNSS module’s serial number              |
| Build Time    | Display GNSS module’s HW build time              |

### 4.11.6 Sky View

This section displays the current sky map of the GNSS receiver tracked satellites.

**Web GUI: Monitor > Timing > GNSS > SkyView**

**Figure 4-111: Sky view display**

**Table 4-105: Sky View parameters**

Displays the sky view of the tracked satellites. The azimuth angle is the angle between the North ('N') and radial on which the satellite is displayed. The elevation angle is represented by the distance from the center (90 degrees) to the edge of the sky map circle (0 degrees). Each satellite icon is positioned according to status and displayed in green (strong receive signal) or orange (fair signal). When pointing on a satellite a text box balloon will automatically open, showing satellite info highlights.

### 4.11.7 Satellite Count

This section displays a graph of the tracked satellites count.

**Web GUI: Monitor > Timing > GNSS > SkyView**

**Figure 4-112: Satellite Count display**

**Table 4-106 Satellite Count parameters**

|                 |                                                                                                                                                                                                                                                             |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Satellite Count | The type of cable being used for the GNSS antenna.                                                                                                                                                                                                          |
| Graph type      | Selection of type of graph to show: Time axis duration can be 15 minutes (1 minute resolution) or 24 hours (15 minutes resolution- Show only good (above threshold) satellites or all visible (tracked)ones.                                                |

## 4.12 IEEE1588 Precision Time Protocol

PTP is an acronym for **P**recision **T**ime **P**rotocol, a network protocol for synchronizing the clocks of Network systems. Regarding Ethernet Backhaul, PTP is considered the technology of choice to deliver clock synchronization to remote telecom base stations. PTP defines synchronization message used between a Master and Slave clock. The Master provides the time, and the slave synchronizes to the Master

Multiple slaves can synchronize to a single Master. The Master clock provides synchronization message that the slaves use to correct their local clocks. This section allows the user to configure and inspect the current PTP Clock settings. In Synchronous mode of operation, the Synchronous Ethernet interface processes the SSM (**Synchronization Status Messages**) and recovers the clock quality level information. The ESMC channel is a logical communication channel which transmits SSM information that is the quality level of the transmitting synchronous Ethernet equipment clock.

When a Synchronous Ethernet port is selected, the SSM are transmitted through this port, indicating the quality level of the clock it can drive. The messages are received (if the other remote unit supports SyncE) with the quality level of the transmitting clock. The remote end unit receiving the messages on its configured Synchronous Ethernet port extracts the clock quality level and transmits it to the Clock Master Unit. The Clock Master Unit receives the SSM data from many Synchronous Ethernet ports and establishes the clock sources. The device internal state logic (clock selector) monitors all reference clocks and automatically selects the best available reference clock based on configured priority and revertive priorities. There are different synchronization methods as described below

The Auto-Revertive is the default mode of operation. This mode includes two functions: automatic reference clock selection (the highest priority qualified clock is selected) and the occurrence of the Revertive function when needed.

The clock selection process supports revertive and non-revertive modes of operation. If the Auto-revertive mode is enabled: when the clock selection process has selected -a primary clock, and the active primary clock source has failed or degraded over a certain period and then is later recovered, this primary clock source becomes again the active clock source. If Auto non-revertive mode is selected and a secondary clock source is active (due to a previous degradation of the primary clock source), the primary clock source is not reactivated even after its quality has been improved.

### Methods of Operation

---

*Note: the following modes of operation can be selected under SyncCenter Configuration.*

---

**Auto Revertive:** In this mode, the highest priority qualified reference clock is selected. If this selected clock fails or it is degraded, the next priority qualified clock is selected, and the lock acquisition will begin. If the previous primary clock is restored and qualified, then the revertive function will compel the previous primary clock to become again the active clock source.

**Auto Non Revertive:** Clock Selection of the best clock source is only done when the selected clock fails. The primary clock source is not reactivated in this case.

**Free-Run mode:** The free-run mode occurs immediately, after a reset, or when the timing synchronization logic has not yet been synchronized to a reference clock input. In this mode the frequency accuracy of the clock outputs is equal to the frequency accuracy of the input master clock.

**Manual:** The user may select the clock source (None, SyncE, PTP, TDM, External) If this manually selected clock source is failing, the clock selector will go into holdover state.

**Normal (Locked mode):** The input clock references are monitored for frequency accuracy and phase correctness. If at least one is of the clock reference inputs is qualified, then the logic will start the lock acquisition of that clock input. And the device logic will enter the normal locked mode. During the normal locked operation, the time synchronization logic phase locks to the qualified reference clock and generates output clocks and frame pulses with a frequency accuracy equal to the frequency accuracy of the input reference clock. The generated clock and frames pulse outputs comply with specifications as described in Telcordia and ITU-T Telecommunication standard.

**Holdover state:** When the timing synchronization logic loses its reference input clock or becomes degraded, and no other qualified clock references are available, it will enter in holdover mode and continue to create output clocks based on the reference frequency data collected during the synchronization process.

**PTP Messages**

PTP defines the following messages for synchronization and control between devices:

**Event message** (timing message): Types of event messages: Sync, Delay\_Req, Pdelay\_Req, Pdelay\_Req.

**General messages:** Announce, Follow-Up, Delay\_Resp, Pdelay\_Resp\_Follow\_Up, Management, Signaling. (Pdelay=Peer delay)

### 4.12.1 PTP Clock Configuration

This section allows the user to configure the PTP clock configuration settings.

---

*Note: By clicking on PTP Config "Add New PTP Clock" you get the following additional display*

---

**Web GUI: Configuration > Timing > PTP**

**PTP Clock Configuration**

| Delete                   | Clock Instance | HW Domain | Device Type | Profile | Clock Description |
|--------------------------|----------------|-----------|-------------|---------|-------------------|
| <input type="checkbox"/> | 0              | 0         | Mastronly   | G8275.1 |                   |
| Delete                   | 1              | 0         | Mastronly   | G8275.2 |                   |

| HW Domain         | Indicates the HW clock domain used by the clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Device Type       | <p>Indicates the Type of the Clock Instance. There are five Device Types.</p> <ol style="list-style-type: none"> <li>1. Ord-Bound – clock’s Device Type is Ordinary-Boundary Clock.</li> <li>2. P2p Transp – clock’s Device Type is Peer to Peer Transparent Clock.</li> <li>3. E2e Transp – clock’s Device Type is End to End Transparent Clock.</li> <li>4. Master Only – clock’s Device Type is Master Only.</li> <li>5. Slave Only – clock’s Device Type is Slave Only.</li> </ol> <p><b>Definitions:</b></p> <p><b>Master &amp; Slave clock:</b> has only one physical port to the network and can be implemented as a master or slave clock. The OC sends and receive PTP messages. It supports the synchronization mechanism.</p> <p><b>Boundary clock:</b> has multiple physical ports to the network and can be used as an intermediate stage/device. The BC performs the functionality of the Ordinary clock and can be connected to multiple sub-networks: normally it is synchronized to one Master reference clock and provides synchronization to various clients.</p> <p><b>End to End Transparent clock:</b> there are multiple ports and do not behave or perform a Master and slave relationship. These ports forward all PTP messages and correct the timing.</p> <p><b>Peer to peer Transparent clock:</b> there are multiple ports and do not behave or perform a Master and slave relationship. Each port supports the Pdelay mechanism</p> |
| Profile           | Indicates the profile used by the clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Clock Description | User defined free text (64 characters)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 4.12.2 PTP Clock's Configuration and Status

This page allows the user to inspect and configure the current PTP clock settings. It contains the following configuration and status tables:

**Web GUI: Configuration > Timing > PTP > (Hit Clock Inst. Number)**

### 4.12.2.1 Clock Type and Profile

#### PTP Clock's Configuration and Status

##### Clock Type and Profile

| Clock Instance | HW Domain | Device Type | Profile | Apply Profile Defaults               |
|----------------|-----------|-------------|---------|--------------------------------------|
| 0              | 0         | Mastronly   | G8275.1 | <input type="button" value="Apply"/> |

**Figure 4-114: Clock Type and Profile**

**Table 4-108: Clock Type and Profile**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clock Instance         | Indicates the Instance of a particular Clock Instance [0...3].                                                                                                                                                                                                                                                                                                                                                                                                                  |
| HW Domain              | Indicates the HW clock domain used by the clock.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Device Type            | Indicates the Type of the Clock Instance. There are five Device Types. <ol style="list-style-type: none"> <li>1. Ord-Bound – clock's Device Type is Ordinary-Boundary Clock.</li> <li>2. P2p Transp – clock's Device Type is Peer to Peer Transparent Clock.</li> <li>3. E2e Transp – clock's Device Type is End to End Transparent Clock.</li> <li>4. Master Only – clock's Device Type is Master Only.</li> <li>5. Slave Only – clock's Device Type is Slave Only.</li> </ol> |
| Profile                | Indicates the profile used by the clock.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Apply Profile Defaults | If the clock has been configured to use a profile, clicking the 'Apply' button will reset configured values to profile defaults.                                                                                                                                                                                                                                                                                                                                                |

### 4.12.2.2 Port Enable and Configuration

#### Port Enable and Configuration

| Port Enable              |                          |                          |                                     |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          |                          | Configuration                                      |
|--------------------------|--------------------------|--------------------------|-------------------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|----------------------------------------------------|
| 1                        | 2                        | 3                        | 4                                   | 5                        | 6                        | 7                        | 8                        | 9                        | 10                       | 11                       | 12                       | 13                       | 14                       | 15                       | 16                       | 17                       | 18                       | 19                       | 20                       | 21                       | Ports Configuration                                |

**Table 4-109: Port Enable and Configuration**

|               |                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------|
| Port Enable   | Set check mark for each port configured for this Clock Instance.                                     |
| Configuration | Click 'Ports Configuration' to edit the port data set for the ports assigned to this clock instance. |

### 4.12.2.3 Local Clock Current Time

#### Local Clock Current Time

| PTP Time                              | Clock Adjustment method | Synchronize to System Clock                                |
|---------------------------------------|-------------------------|------------------------------------------------------------|
| 2022-05-23T09:00:39+02:00 051,375,049 | Internal Timer          | <input type="button" value="Synchronize to System Clock"/> |

**Figure 4-116: Local Clock Current time**

**Table 4-110: Local Clock Current time**

|                             |                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------|
| PTP Time                    | Shows the actual PTP time with nanosecond resolution.                                   |
| Clock Adjustment Method     | Shows the actual clock adjustment method. The method depends on the available hardware. |
| Synchronize to System Clock | Activate this button to synchronize the System Clock to PTP Time.                       |

#### 4.12.2.4 Clock Current DataSet

**Clock Current DataSet**

| stpRm | Offset From Master | Mean Path Delay   |
|-------|--------------------|-------------------|
| 0     | 0.000,000,000,000  | 0.000,000,000,000 |

**Figure 4-117: Clock Type and Profile**

**Table 4-111: Clock Type and Profile**

|                    |                                                                                                        |
|--------------------|--------------------------------------------------------------------------------------------------------|
| stpRm              | Steps Removed: It is the number of PTP clocks traversed from the grandmaster to the local slave clock. |
| Offset From Master | Time difference between the master clock and the local slave clock, measured in ns.                    |
| Mean Path Delay    | The mean propagation time for the link between the master and the local slave.                         |

#### 4.12.2.5 Clock Parent Data Set

The clock parent data set is defined in the IEEE 1588 standard. The parent data set is dynamic.

**Clock Parent DataSet**

| Parent Port ID          | port | PStat | Var | Rate | GrandMaster ID          | GrandMaster Clock Quality | Pri1 | Pri2 |
|-------------------------|------|-------|-----|------|-------------------------|---------------------------|------|------|
| 00:05:80:ff:fe:07:85:e0 | 0    | False | 0   | 0    | 00:05:80:ff:fe:07:85:e0 | Cl:006 Ac:100 ns Va:20061 | 128  | 128  |

**Figure 4-118: Clock Type and Profile**

**Table 4-112: Clock Type and Profile**

|                            |                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------|
| Parent Port ID             | Clock identity for the parent clock, if the local clock is not a slave, the value is the clocks own id.                |
| Port                       | Port Id for the parent master port.                                                                                    |
| PStat                      | Parents Stats (always false).                                                                                          |
| Var                        | It is observed parent offset scaled log variance.                                                                      |
| Rate                       | Observed Parent Clock Phase Change Rate. i.e., the slave clocks rate offset compared to the master. (unit = ns per s). |
| Grand Master ID            | Clock identity for the grand master clock, if the local clock is not a slave, the value is the clocks own id.          |
| Grand Master Clock Quality | The clock quality announced by the grand master (See description of Clock Default DataSet:Clock Quality)               |
| Pri1                       | Clock priority 1 announced by the grand master.                                                                        |
| Pri2                       | Clock priority 2 announced by the grand master.                                                                        |

### 4.12.2.6 Clock Default DataSet

The clock default data set is defined in the IEEE 1588 Standard. It holds three groups of data: the static members defined at clock creation time, the Dynamic members defined by the system, and the configurable members which can be set here.

**Clock Default DataSet**

| Device Type | One-Way | 2 Step Flag | Ports      | Clock Identity          | Dom | Clock Quality             |
|-------------|---------|-------------|------------|-------------------------|-----|---------------------------|
| Mastronly   | False ▾ | False ▾     | 21         | 00:05:80:ff:fe:07:85:e0 | 24  | Cl:006 Ac:100 ns Va:20061 |
| Pri1        | Pri2    | Local Prio  | Protocol   | VID                     | PCP | DSCP                      |
| 128         | 128     | 128         | Ethernet ▾ | 1                       | 0 ▾ | 0                         |

**Figure 4-119: Clock Default DataSet**

**Table 4-113: Clock Default DataSet**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Type    | Indicates the Type of the Clock Instance. There are five Device Types. <ol style="list-style-type: none"> <li>1. Ord-Bound – clock’s Device Type is Ordinary-Boundary Clock.</li> <li>2. P2p Transp – clock’s Device Type is Peer to Peer Transparent Clock.</li> <li>3. E2e Transp – clock’s Device Type is End to End Transparent Clock.</li> <li>4. Master Only – clock’s Device Type is Master Only.</li> <li>5. Slave Only – clock’s Device Type is Slave Only.</li> </ol>                                                                                                       |
| One-Way        | If true, one way measurements are used. This parameter applies only to a slave. In one-way mode no delay measurements are performed, i.e. this is applicable only if frequency synchronization is needed. The master always responds to delay requests.                                                                                                                                                                                                                                                                                                                               |
| 2 Step Flag    | True if two-step Sync events and Pdelay_Resp events are used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Ports          | The total number of physical ports in the node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Clock Identity | It shows unique clock identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Dom            | Clock domain [0..127].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Clock Quality  | The clock quality is determined by the system, and holds 3 parts: Clock Class, Clock Accuracy and OffsetScaledLog Variance as defined in IEEE1588.<br><br>The Clock Accuracy values are defined in IEEE1588 table 6 (Currently the clock Accuracy is set to 'Unknown' as default).                                                                                                                                                                                                                                                                                                    |
| Pri1           | Clock priority 1 [0..255] used by the BMC master select algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Pri2           | Clock priority 2 [0..255] used by the BMC master select algorithm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Local Prio     | Priority [1..255] used in the 8275.1 BMCA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Protocol       | Transport protocol used by the PTP protocol engine<br>Ethernet PTP over Ethernet multicast<br>EthernetMixed PTP using a combination of Ethernet multicast and unicast<br>IPv4Multi PTP over IPv4 multicast<br>IPv4Mixed PTP using a combination of IPv4 multicast and unicast<br>IPv4Uni PTP over IPv4 unicast<br>IPv6Mixed PTP using a combination of IPv6 multicast and unicast. Currently, this is supported for only One step E2E Transparent clock.<br>EthIPv4IPv6Combo PTP using any one of Ethernet, IPv4 or IPv6. This is supported for only one step E2E Transparent clocks. |

|      |                                                              |
|------|--------------------------------------------------------------|
| VID  | VLAN Identifier used for tagging the VLAN packets.           |
| PCP  | Priority Code Point value used for PTP frames.               |
| DSCP | DSCP value used when transmitting IPv4 encapsulated packets. |

#### 4.12.2.7 Master Enable on State

The Master Enable on State allow the user to control the PTP instance message transmission based on the SyncCenter operational state. PTP transmission can be set to one of the following modes per SyncCenter state:

- Disabled – PTP transmission deactivated
- Enabled - PTP transmission activated
- Rule 0 - PTP transmission activation is conditioned to Instance 0 state

Master Enable on State

| Free Run | Lock Acquisition | Locked   | Holdover | Holdover Recovery |
|----------|------------------|----------|----------|-------------------|
| Enable ▾ | Enable ▾         | Enable ▾ | Enable ▾ | Enable ▾          |

Figure 4-120: Master Enable on State

Table 4-114: Master Enable on State

|                   |                                                                        |
|-------------------|------------------------------------------------------------------------|
| Free Run          | In Free Run state PTP can be set to: Disable, Enable, Rule 0.          |
| Lock Acquisition  | In Lock Acquisition state PTP can be set to: Disable, Enable, Rule 0.  |
| Locked            | In Locked state PTP can be set to: Disable, Enable, Rule 0.            |
| Holdover          | In Holdover state PTP can be set to: Disable, Enable, Rule 0.          |
| Holdover Recovery | In Holdover Recovery state PTP can be set to: Disable, Enable, Rule 0. |

#### 4.12.2.8 Quality Override

Quality Override

| Class                      | Accuracy                   | Variance                   |
|----------------------------|----------------------------|----------------------------|
| <input type="checkbox"/> 0 | <input type="checkbox"/> 0 | <input type="checkbox"/> 0 |

Figure 4-121: Quality Override

|          |                                                                           |
|----------|---------------------------------------------------------------------------|
| Class    | Tick checkbox to enable Clock Class override, then set the desired value. |
| Accuracy | Tick checkbox to enable Accuracy override, then set the desired value.    |
| Variance | Tick checkbox to enable Variance override, then set the desired value.    |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clock Instance       | Indicates the Instance of a particular Clock Instance [0...3]                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ClkDom HW Domain     | Refers to Clock HW Domain                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Device Type          | Indicates the Type of the Clock Instance. There are five Clock Types: <ul style="list-style-type: none"> <li>• <b>Boundary</b> – clock’s Type is Ordinary-Boundary Clock.</li> <li>• <b>Transparent (P2P)</b> – Clock’s Type is Peer to Peer Transparent Clock.</li> <li>• <b>Transparent (E2E)</b> – Clock’s Type is End to End Transparent Clock</li> <li>• <b>Master Only</b> - Clock’s e Type is Master Only.</li> <li>• <b>Slave Only</b> - Clock’s Type is Slave Only.</li> </ul> |
| Profile              | Indicates the profile used by the clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PTP Time             | Shows the actual PTP time with nanosecond resolution.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Clock Adjust. Method | Shows the actual clock adjustment method. The method depends on the available hardware.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Ports Monitor Page   | Click to monitor the port data set for the ports assigned to this clock instance.                                                                                                                                                                                                                                                                                                                                                                                                       |

|                    |                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| One-Way            | If true, one-way measurements are used. This parameter applies only to a slave. In one-way mode no delay measurements are performed, i.e. this is applicable only if frequency synchronization is needed. The master always responds to delay requests.                                                                                                                      |
| 2 Step Flag        | True if two-step Sync events and Pdelay_Resp events are used.                                                                                                                                                                                                                                                                                                                |
| Ports              | The total number of physical ports in the node.                                                                                                                                                                                                                                                                                                                              |
| Clock Identity     | It shows unique clock identifier.                                                                                                                                                                                                                                                                                                                                            |
| Dom                | Clock domain [0..127].                                                                                                                                                                                                                                                                                                                                                       |
| Clock Quality      | The clock quality is determined by the system, and holds 3 parts: Clock Class, Clock Accuracy and OffsetScaledLog Variance as defined in IEEE1588.<br><br>The Clock Accuracy values are defined in IEEE1588 table 6 (Currently the clock Accuracy is set to 'Unknown' as default).                                                                                           |
| Pri1               | Clock priority 1 [0..255] used by the BMC master select algorithm.                                                                                                                                                                                                                                                                                                           |
| Pri2               | Clock priority 2 [0..255] used by the BMC master select algorithm.                                                                                                                                                                                                                                                                                                           |
| Local Prio         | Local priority for G8275.1 BMC algorithm (1 is highest priority).                                                                                                                                                                                                                                                                                                            |
| Protocol           | <ul style="list-style-type: none"> <li>• Transport protocol used by the PTP protocol engine</li> <li>• Ethernet PTP over Ethernet multicast</li> <li>• ip4multi PTP over IPv4 multicast</li> <li>• ip4uni PTP over IPv4 unicast</li> </ul>                                                                                                                                   |
| VID                | VLAN Identifier used for tagging the PTP frames.<br><br>Note: Packets are tagged if the port is configured for vlan tagging for the configured VID.                                                                                                                                                                                                                          |
| PCP                | Priority Code Point value used for PTP frames.                                                                                                                                                                                                                                                                                                                               |
| DSCP               | Priority Code Point value used for PTP frames.                                                                                                                                                                                                                                                                                                                               |
| stpRm              | Steps Removed: It is the number of PTP clocks traversed from the grandmaster to the local slave clock.                                                                                                                                                                                                                                                                       |
| Offset From Master | Time difference between the master clock and the local slave clock, measured in ns.                                                                                                                                                                                                                                                                                          |
| Mean Path Delay    | The mean propagation time for the link between the master and the local slave.                                                                                                                                                                                                                                                                                               |
| Slave Port         | Shows which port is in slave mode. The value is 0 if no ports are in slave mode.                                                                                                                                                                                                                                                                                             |
| Slave State        | Shows synchronization state of the slave (Slave only/Boundary): FREERUN, FREQ_LOCKING, PHASE_LOCKING, PHASE_LOCKED, HOLDOVER.                                                                                                                                                                                                                                                |
| Holdover(ppb)      | After the slave has been in Locked mode during the stabilization period, this value shows the actual clock offset between the free run and the actual holdover frequency, the value is shown in parts pr billion (ppb). During the stabilization period, the value is shown as N.A. The stabilization period is 60 sec as default, it can be changed from the CLI interface. |

|                           |                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Parent Port ID            | Clock identity for the parent clock, if the local clock is not a slave, the value is the clocks own id.                                           |
| Port                      | Port Id for the parent master port.                                                                                                               |
| PStat                     | Parents Stats (always false).                                                                                                                     |
| Var                       | It is observed parent offset scaled log variance.                                                                                                 |
| Rate                      | Observed Parent Clock Phase Change Rate. i.e. the slave clocks rate offset compared to the master. (unit = ns per s).                             |
| GrandMaster ID            | Clock identity for the grand master clock, if the local clock is not a slave, the value is the clocks own id.                                     |
| GrandMaster Clock Quality | The clock quality announced by the grand master (See description of Clock Default DataSet:Clock Quality).                                         |
| Pri1                      | Clock priority 1 announced by the grand master.                                                                                                   |
| Pri2                      | Clock priority 2 announced by the grand master.                                                                                                   |
| Tx Enabled                | Green – Indicates Master is enabled for PTP transmission.<br>Red – Indicates Master is NOT enabled for PTP transmission.                          |
| UtcOffset                 | In systems whose epoch is UTC, it is the offset between TAI and UTC.                                                                              |
| Valid                     | When true, the value of currentUtcOffset is valid.                                                                                                |
| leap59                    | When true, this field indicates that last minute of the current UTC day has only 59 seconds.                                                      |
| leap61                    | When true, this field indicates that last minute of the current UTC day has 61 seconds.                                                           |
| Time Trac                 | True if the timescale and the value of currentUtcOffset are traceable to a primary reference.                                                     |
| Freq Trac                 | True if the frequency determining the timescale is traceable to a primary reference.                                                              |
| ptp Time Scale            | True if the clock timescale of the grandmaster clock and false otherwise.                                                                         |
| Time Source               | The source of time used by the grandmaster clock.                                                                                                 |

**Table 4-119: PTP Slave Table**

|                    |                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #                  | Index of slave (has no functional impact).                                                                                                                                                                                                                                                                          |
| Clock Instance     | The master's clock instance.                                                                                                                                                                                                                                                                                        |
| IP Address         | The slave's IP address.                                                                                                                                                                                                                                                                                             |
| Port #             | The master's port number.                                                                                                                                                                                                                                                                                           |
| MAC Address        | The MAC address of the slave (or the gateway's).                                                                                                                                                                                                                                                                    |
| Status             | <b>Sync</b> - Indicates Sync messages are transmitted to the slave.<br><b>Ann</b> - Indicates Announce messages are transmitted to the slave.                                                                                                                                                                       |
| Message rate (FPS) | <b>Sync</b> - The current rate of Sync messages to the slave (as negotiated with the master).<br><b>DelReq</b> - The current rate of Delay Request messages from the slave (as negotiated with the master).<br><b>Announce</b> - The current rate of Announce messages to the slave (as negotiated with the master) |

The slave device must collect 4 timestamps when PTP Sync and Del.Req messages are transmitted and received in order to calculate the offset from master clock.

## 4.13 Synchronous Ethernet (SyncE)

### 4.13.1 Overview

This section allows the user to inspect and configure the current SyncE port settings. SyncE is used to make an Ethernet network 'clock frequency' synchronized. Mobile network operators have started to deploy 4G/LTE networks. Ethernet has become the logical choice for mobile backhaul. These operators would like to deploy voice over Ethernet. Ethernet networks must provide timing and synchronization to enable proper operation of the mobile services. **The Falcon-RX devices** are offered with complete precision timing support based on Synchronous Ethernet and 1588-2008 (PTP) for LTE mobile backhaul applications.

The aim of Synchronous Ethernet is to provide a synchronous signal to network resources that may need such frequency synchronization signal. SyncE was standardized by the ITU-T and supports the following recommendations:

**ITU-T G8261** standard that defines aspects regarding the architecture and performance of SyncE networks.

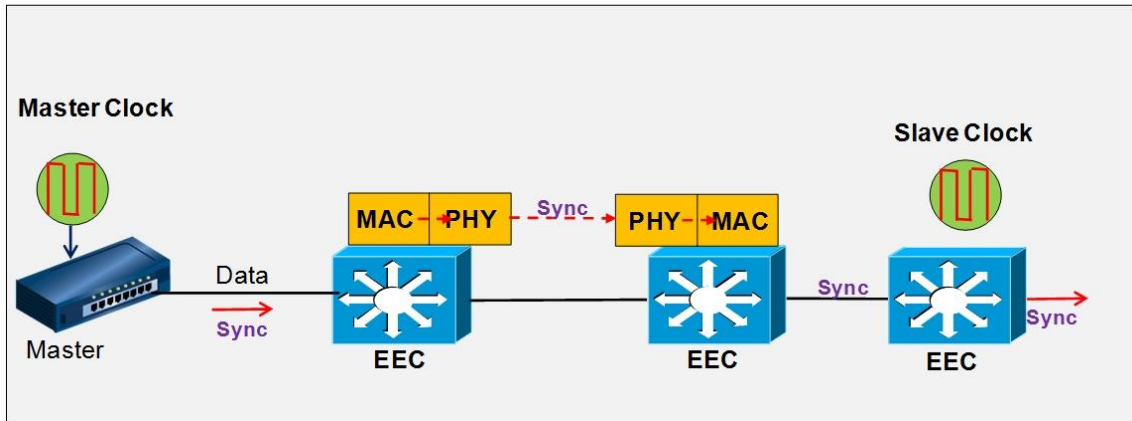

**ITU-T G8262** standard which specifies SyncE slave clocks.

**ITU-T G8264** standard that describes the specifications of Ethernet Synchronization Messaging Channel (ESMC)

In Synchronous mode of operation, the Synchronous Ethernet interface processes the SSM (**Synchronization Status Messages**) and recovers the clock quality level information. The ESMC channel is a logical communication channel which transmits SSM information, that is the quality level of the transmitting synchronous Ethernet equipment clock.

When a Synchronous Ethernet port is selected, the SSM are transmitted through this port, indicating the quality level of the clock it can drive. The messages are received (if the other remote unit supports SyncE) with the quality level of the transmitting clock. The remote end unit receiving the messages on its configured Synchronous Ethernet port extracts the clock quality level and transmits it to the Clock Master Unit. The Clock Master Unit receives the SSM data from many Synchronous Ethernet ports and establishes the clock sources. The device internal state logic (clock selector) monitors all reference clocks and automatically selects the best available reference clock based on configured priority and revertive priorities.

**SyncE Basic mechanism**

The master switch receives the external clock which is a high precision clock. In a synchronous Ethernet network, Ethernet data is carried over layer 2 whereas the sync timing signals over physical layer 1. All internal clocks should be synchronized by the external reference clock.

The Ethernet interfaces are designed with an internal clock which is synchronized by the master external clock. SyncE enables the transport of slave synchronization signals within the entire network.

The EEC devices are defined as Ethernet Equipment Slave clocks. Ethernet interfaces are also able to generate their own synchronization clock in case they lose the master reference clock (this situation is defined as holdover state).

The SyncE Configuration procedure for the R Class series es includes the following display:

**4.13.2 SyncE Port Configuration**

This section displays and allows configuration of the SyncE configuration of the applicable Ethernet ports.

| Port                   | The port number to configure.                                                                                                                                                                    |
| SSM Enable             | Enable and disable of SSM functionality on this port.                                                                                                                                            |
| Tx SSM: Quality Level  | Monitoring of the transmitted SSM QL on this port. Transmitted QL should be the Quality Level of the clock generated by this node. This means the QL of the clock source this node is locked to. |
| Tx SSM: SSM code (hex) | Displaying the actual hex code used to indicate the transmitted Quality.                                                                                                                         |

|                        |                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx SSM: Quality Level  | Monitoring of the received SSM QL on this port. If link is down on port, QL_LINK is indicated. If no SSM is received, QL_FAIL is indicated.                                                                    |
| Rx SSM: SSM code (hex) |                                                                                                                                                                                                                |
| 1000BaseT Mode         | If PHY is in 1000BaseT Mode then this is monitoring the master/slave mode. In order to receive clock on a port, it has to be in slave mode. In order to transmit clock on a port, it has to be in master mode. |

### 4.13.3 SyncE Port Monitoring

This section displays and allows configuration of the SyncE configuration of the applicable Ethernet ports.

**Web GUI: Monitor > Timing > SyncE**

|                      |              |
|----------------------|--------------|
| <b>SSM Option</b>    | SSM Option 1 |
| <b>SSM Free Run</b>  | QL EEC1      |
| <b>SSM Hold Over</b> | QL SSUB      |

**SyncE Ports**

| Port | Tx SSM |               |                |             |       | Rx SSM |               |                |             |       | Clear |
|------|--------|---------------|----------------|-------------|-------|--------|---------------|----------------|-------------|-------|-------|
|      | Status | Quality level | SSM code (hex) | Information | Event | Status | Quality level | SSM code (hex) | Information | Event |       |

**Table 4-125: External Status parameters**

|                |                                                                                  |
|----------------|----------------------------------------------------------------------------------|
| Port           | Indicates sync port number.                                                      |
| Mode           | Indicates whether the Sync port's state is Enabled or Disabled.                  |
| Direction      | Indicates whether the Sync port's direction is Input or Output.                  |
| Output Type    | Indicates the Sync port's Output type.                                           |
| Input          | Indicates the Sync port's Input type.                                            |
| Quality Option | Indicates the Sync port's Input Quality Option                                   |
| Input Quality  | Indicates the Sync port's Input Quality level                                    |
| Buttons        | <b>External Configuration:</b> click to go to External Clock Configuration page. |

## 4.15 Spanning Tree

Spanning Tree Protocol was developed to protect Ethernet networks from the bad effects of network loops: a loop is a circular path in the network which causes frame storms that overloads the Ethernet network.

Spanning Tree Protocol creates a spanning tree within a mesh network of connected Ethernet bridges and disables the links which are not part of that tree, leaving a single active path between any two network nodes.

---

*Note: Spanning Tree is available in all Falcon R devices*

---

### Spanning Tree Versions:

- 802.1d Legacy Spanning Tree
- 802.1w Rapid Spanning Tree

Faster topology conversion by:

A faster method for temporary loop prevention: STP waits for the new topology to stabilize while RSTP makes the new root port forwarding immediately once all prior root ports have been made blocking, and then uses handshaking (on point-to-point links) to make designated ports forwarding as well.

Improvements in topology change detection, notification, and flushing of the learn tables.

- 802.1s Multiple-Instance Spanning Tree

A newer version supporting more than a single topology: each instance (group of VLANs) can have its own topology.

### 4.15.1 Understanding RSTP and MSTP

#### 4.15.1.1 Understanding RSTP

STP provides basic loop prevention functionality with slow network convergence when topology changes occur.

RSTP converges faster because a handshake mechanism is deployed, based on P2P links instead of the timer-based process used by STP.

Under RTSP, port assignments change through exchanged messages RSTP device generates configuration messages once every hello time interval.

An RTSP device will respond to BPDUs sent from the root bridge. The RSTP device will propose its spanning tree information to its designated ports.

If another RSTP device receives this information and determines that this is the superior root information, it starts a synchronizing operation to ensure all its ports are in sync with the new information. This device may send an “agreement” to the first RSTP device confirming its superior spanning tree information.

The first RSTP device, upon receiving this agreement, knows now that it can rapidly change that port to the forwarding state.

Similar proposal agreement handshake messages propagate within the network, restoring the connectivity very quickly after a topology change, bypassing the traditional listening/learning state transition process.

Therefore, a cascading effect is created away from the RSTP root where each designated port proposes to its neighbors to determine if a rapid transition is possible. In this way RSTP achieves faster convergence times than STP.

RSTP device port roles:

Root – A forwarding port that is the best port from no root-bridge to Root bridge.

Designated –A forwarding port for every LAN segment.

Alternate – An alternate port to the root bridge.

Disabled – A network administrator can manually disable a port.

Backup – provides an alternate designated port.

#### 4.15.1.2 Understanding MSTP

RSTP does not solve the problem inherent in STP: all VLANs within a LAN must share the same spanning tree topology. An STP or RSTP network has only one spanning tree instance for the entire network and includes all VLANs in the network. Falcon switches utilize the Multiple Spanning Tree protocol (MSTP, 802.1s) to ensure that only one active path exists between any two nodes in a spanning tree instance. An instance includes a unique set of VLANs, belongs to a specific spanning tree region and creates a separate per instance forwarding topology.

A region may comprise multiple spanning tree instances (each with a different set of VLANs). Each spanning tree instance is independent of other instances. Each region can support up to 16 spanning tree instances.

MSTP region: a group of interconnected switches that share the same attributes is defined as an MST region. An MST region includes multiple spanning tree instances (MSTI) which provide different paths for different VLAN. Each MSTI can have its own independent topology. Note that MSTP recognizes an STP or RSTP LAN as a distinct spanning tree region.

A region can include two types of STP instances:

- Internal Spanning Tree Instance (IST instance). This is the default spanning tree instance in any MST region. IST provides the root switch for the region and by default comprises all VLANs in the region except those VLANs assigned to MSTI.
- Multiple Spanning Tree Instance (MSTI). This type of configurable STP instance includes assigned VLANs which operate as part of the same single spanning tree topology. IST instance is defined as Instance 0 whereas all other MST instances are numbered from 1 to 15.
- All MST instances within the same region share the same protocol timers, each MST instance has its own topology Parameters, such root switch ID, root path cost and additional selected Parameters.

#### 4.15.1.2.1 Common and Internal Spanning Tree (CSTI):

CSTI is a collection of the IST in each region and the Common Spanning Tree (CST) which interconnects the various MST regions and STP LANs, and RSTP LANs in a switched network.

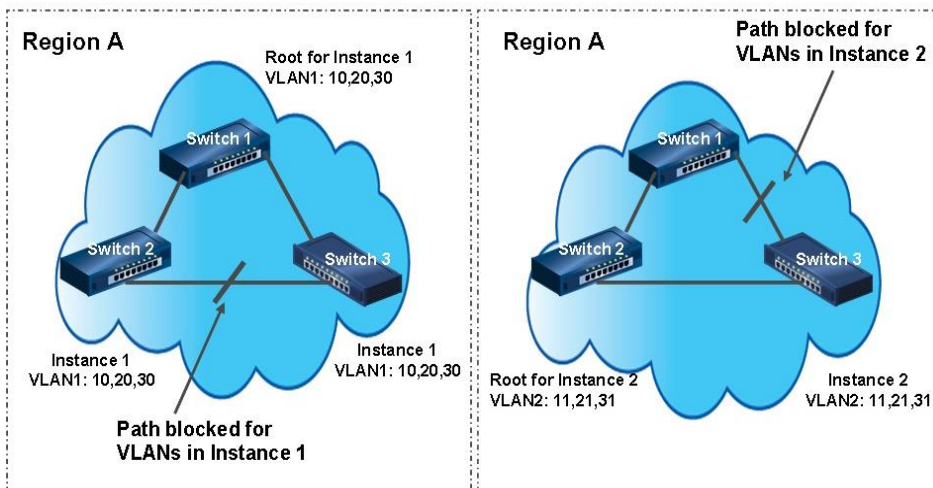

The CIST is created as a result of the STP algorithm running between switches that support the 802.1w, and the 802.ID protocols. MSTP allows for rapid port state transition just like RSTP. MSTP is compatible to STP and RSTP.

#### 4.15.1.2.2 Example of a Multiple Spanning Tree Application

Assume we have tree switches in a region configured with VLANs grouped in two instances, as follows:

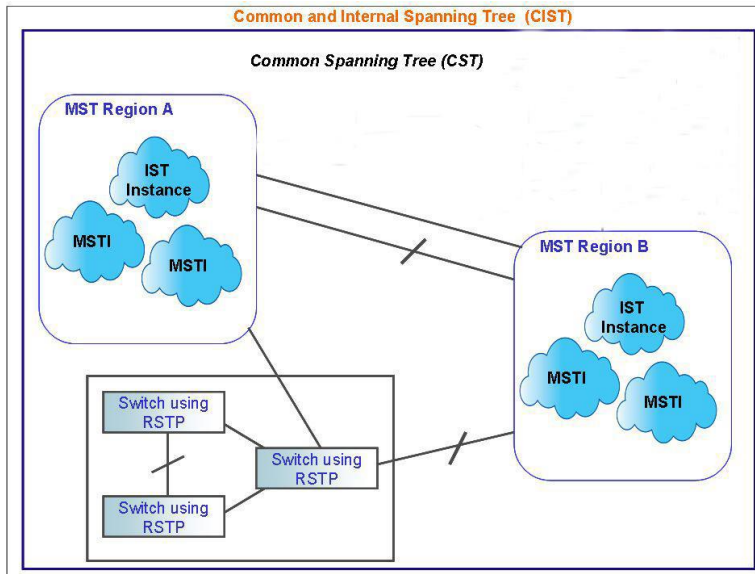

VLAN1 (10, 20, 30) mapped to Instance 1; VLAN2 (11, 21, 31) mapped to Instance 2. The logical topologies shown in the below drawing are the result from these VLAN/Instance grouping resulting on different blocked links for different VLANs as shown.

The MSTP configuration commands operate exactly like RSTP commands and MSTP is compatible with the RSTP and STP enable switches in our network.

### MSTP Network

MSTP interconnects between various MST regions and maps active and separate paths through separate spanning tree instances. The below drawing depicts an MSTP network MSTP distinguish an STP or RSTP LAN as a distinct separate STP region.

### 4.15.2 Bridge settings

Spanning Tree protocol version (STP, RSTP or MSTP) is selected according to the networking environment. R Class series devices allows STP, RSTP, MSTP system settings configuration as detailed below.

**Web GUI: Configuration > Spanning Tree > Bridge Settings**

#### STP Bridge Configuration

| Basic Settings      |       |
|---------------------|-------|
| Protocol Version    | MSTP  |
| Bridge Priority     | 32768 |
| Hello Time          | 2     |
| Forward Delay       | 15    |
| Max Age             | 20    |
| Maximum Hop Count   | 20    |
| Transmit Hold Count | 6     |

| Advanced Settings           |                          |
|-----------------------------|--------------------------|
| Edge Port BPDU Filtering    | <input type="checkbox"/> |
| Edge Port BPDU Guard        | <input type="checkbox"/> |
| Port Error Recovery         | <input type="checkbox"/> |
| Port Error Recovery Timeout | <input type="text"/>     |

Apply    Reset

Figure 4-132: STP Bridge Configuration

Table 4-126: STP Bridge Configuration Parameters

| Basic Settings   |                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------|
| Protocol version | The MSTP / RSTP / STP protocol version setting. Valid values are <b>STP</b> , <b>RSTP</b> and <b>MSTP</b> . |

|                             |                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bridge Priority             | Controls the bridge priority. Lower numeric values have better priority. The bridge priority plus the MSTI instance number, concatenated with the 6-byte MAC address of the switch forms a Bridge Identifier. For MSTP operation, this is the priority of the CIST. Otherwise, this is the priority of the STP/RSTP bridge. |
| Hello Time                  | The interval between sending STP BPDU's. Valid values are in the range 1 to 10 seconds, default is 2 seconds.<br><br><hr/> <i>Note: Changing this parameter from the default value is not recommended and may have adverse effects on your network.</i> <hr/>                                                               |
| Forward Delay               | The delay used by STP Bridges to transition Root and Designated Ports to Forwarding (used in STP compatible mode). Valid values are in the range 4 to 30 seconds.                                                                                                                                                           |
| Max Age                     | The maximum age of the information transmitted by the Bridge when it is the Root Bridge. Valid values are in the range 6 to 40 seconds, and Max Age must be $\leq (\text{FwdDelay}-1) * 2$ .                                                                                                                                |
| Maximum Hop Count           | This defines the initial value of remaining Hops for MSTI information generated at the boundary of a MSTI region. It defines how many bridges a root bridge can distribute its BPDU information to. Valid values are in the range 6 to 40 hops.                                                                             |
| Transmit Hold Count         | The number of BPDU's a bridge port can send per second. When exceeded, transmission of the next BPDU will be delayed. Valid values are in the range 1 to 10 BPDU's per second.                                                                                                                                              |
| <b>Advanced Settings</b>    |                                                                                                                                                                                                                                                                                                                             |
| Edge Port BPDU Filtering    | Controls whether a port, <i>explicitly</i> configured as <b>Edge</b> , will transmit and receive BPDUs.                                                                                                                                                                                                                     |
| Edge Port BPDU Guard        | Control whether a port, explicitly configured as <b>Edge</b> , will disable itself upon reception of a BPDU. The port will enter the error-disabled state and will be removed from the active topology.                                                                                                                     |
| Port Error Recovery         | Control whether a port in the error-disabled state automatically will be enabled after a certain time. If recovery is not enabled, ports must be disabled and re-enabled for normal STP operation. This condition is also cleared by a system reboot.                                                                       |
| Port Error Recovery Timeout | The time that must pass before a port in the error-disabled state can be enabled. Valid values are between 30 and 86400 seconds (24 hours).                                                                                                                                                                                 |

### 4.15.3 MSTI Configuration

This section allows the user to inspect the current STP MSTI bridge instance (group of VLANs) priority configurations, and possibly change them as well.

Add VLANs separated by spaces or comma.

**Web GUI: Configuration > Spanning Tree > MSTI Mapping**

**MSTI Configuration**

Add VLANs separated by spaces or comma.

**Unmapped VLANs are mapped to the CIST.** (The default bridge instance).

**Table 4-129: CIST Port Configuration displays Parameters**

| CIST Aggregated and Normal Port Configurations |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                                           | The switch port number of the logical STP port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| STP Enabled                                    | Controls whether STP is enabled on this switch port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Path Cost                                      | Controls the path cost incurred by the port. The <b>Auto</b> setting will set the path cost as appropriate by the physical link speed, using the 802.1D recommended values. Using the <b>Specific</b> setting, a user-defined value can be entered. The path cost is used when establishing the active topology of the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. Valid values are in the range 1 to 200000000.                                                                                                                                                                |
| Priority                                       | Controls the port priority. This can be used to control priority of ports having identical port cost. (See above).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OperEdge (state flag)                          | Operational flag describing whether the port is connecting directly to edge devices. (No Bridges attached). Transitioning to the forwarding state is faster for edge ports (having <i>operEdge</i> true) than for other ports. The value of this flag is based on AdminEdge and AutoEdge fields. This flag is displayed as Edge in <b>Monitor-&gt;Spanning Tree -&gt; STP Detailed Bridge Status</b> .                                                                                                                                                                                                                                |
| AdminEdge                                      | Controls whether the <i>operEdge</i> flag should start as being set or cleared. (The initial <i>operEdge</i> state when a port is initialized).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| AutoEdge                                       | Controls whether the bridge should enable automatic edge detection on the bridge port. This allows <b>operEdge</b> to be derived from whether BPDU's are received on the port or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Restricted Role                                | <p>If enabled, causes the port not to be selected as Root Port for the CIST or any MSTI, even if it has the best spanning tree priority vector.</p> <p>Such a port will be selected as an <b>Alternate Port</b> after the Root Port has been selected.</p> <p>If set, it can cause lack of spanning tree connectivity. It can be set by a network administrator to prevent bridges external to a core region of the network influencing the spanning tree active topology, possibly because those bridges are not under the full control of the administrator. This feature is also known as <b>Root Guard</b>.</p>                   |
| Restricted TCN                                 | <p>If enabled, causes the port not to propagate received topology change notifications and topology changes to other ports.</p> <p>If set it can cause temporary loss of connectivity after changes in a spanning trees active topology as a result of persistent incorrectly learned station location information.</p> <p>It is set by a network administrator to prevent bridges external to a core region of the network, causing address flushing in that region, possibly because those bridges are not under the full control of the administrator or is the physical link state for the attached LANs changing frequently.</p> |

| CIST Aggregated and Normal Port Configurations |                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BPDU Guard                                     | If enabled, causes the port to disable itself upon receiving valid BPDU's. Contrary to the similar bridge setting, the port <b>Edge</b> status does not affect this setting. A port entering error-disabled state due to this setting is subject to the bridge <b>Port Error Recovery</b> setting as well, located at <a href="#">STP Bridge Setting</a> |
| Point to Point                                 | Controls whether the port connects to a point-to-point LAN rather than a shared medium. This can be automatically determined or forced either true or false. Transition to the forwarding state is faster for point-to-point LANs than for shared media.                                                                                                 |

### 4.15.6 MSTI Port Configuration

This section allows the user to inspect the current STP MSTI port configurations, and possibly change them as well.

A MSTI port is a virtual port, which is instantiated separately for each active CIST (physical) port for each MSTI instance configured and applicable for the port. The MSTI instance must be selected before displaying actual MSTI port configuration options.

This page contains MSTI port settings **for physical and aggregated ports.**

By clicking on **Get** we get the below display for the selected MSTI.

#### Web GUI: Configuration > Spanning Tree > MSTI Ports

##### MST1 MSTI Port Configuration

MSTI Aggregated Ports Configuration

| Port | Path Cost | Priority |
|------|-----------|----------|
| -    | Auto      | 128      |

MSTI Normal Ports Configuration

| Port | Path Cost | Priority |
|------|-----------|----------|
| *    | <>        | <>       |
| 1    | Auto      | 128      |
| 2    | Auto      | 128      |

| 20   | Auto      | 128      |
| 21   | Auto      | 128      |

Figure 4-136: MSTI Port Configuration

**Table 4-130: MSTI Port Configuration Parameters**

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port      | The switch port number of the corresponding STP CIST (and MSTI) port.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Path Cost | Controls the path cost incurred by the port. The <b>Auto</b> setting will set the path cost as appropriate by the physical link speed, using the 802.1D recommended values. Using the <b>Specific</b> setting, a user-defined value can be entered. The path cost is used when establishing the active topology of the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. Valid values are in the range 1 to 200000000. |
| Priority  | Controls the port priority. This can be used to control priority of ports having identical port cost. (See above). Lower priority is better.                                                                                                                                                                                                                                                                                                                           |
| Buttons   | <b>Get:</b> Click to retrieve settings for a specific MSTI.                                                                                                                                                                                                                                                                                                                                                                                                            |

## 4.15.7 Spanning Tree Monitoring

This section provides various STP monitoring displays.

### 4.15.7.1 STP Bridges Status

This display provides a status overview of all STP bridge instances.

**Web GUI: Monitor > Spanning Tree > Bridge Status**

**STP Bridges** Auto-refresh  Refresh

| MSTI                 | Bridge ID               | Root                    |      |      | Topology Flag | Topology Change Last |
|----------------------|-------------------------|-------------------------|------|------|---------------|----------------------|
|                      |                         | ID                      | Port | Cost |               |                      |
| <a href="#">CIST</a> | 32768.00-05-80-11-CC-FF | 32768.00-05-80-11-CC-FF | -    | 0    | Steady        | 23d 20:36:43         |

**Table 4-131: STP Bridges Parameters**

|                      |                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSTI                 | The Bridge Instance. <a href="#">CIST</a> also a link to the <a href="#">STP Detailed Bridge Status</a> .                                              |
| Bridge ID            | The Bridge ID of this Bridge instance.                                                                                                                 |
| Root ID              | The Bridge ID of the currently elected root bridge.                                                                                                    |
| Root Port            | The switch port currently assigned the root port role.                                                                                                 |
| Root Cost            | Root Path Cost. For the Root Bridge it is zero. For all other Bridges, it is the sum of the Port Path Costs on the least cost path to the Root Bridge. |
| Topology Flag        | The current state of the Topology Change Flag of this Bridge instance.                                                                                 |
| Topology Change Last | The time since last Topology Change occurred.                                                                                                          |

By clicking on [CIST](#) on above display, an additional display is shown below (STP Detailed Bridge Status). This display provides detailed information on a single STP bridge instance, along with port state for all active associated ports. Refer to next sub-section for more details.

### 4.15.7.2 STP Detailed Bridge Status

This section provides detailed information on a single [STP](#) bridge instance, along with port state for all active ports associated.

Web GUI: Monitor > Spanning Tree > Bridge Status | MSTI

|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bridge Instance                 | The Bridge instance -CIST, MSTI...                                                                                                                                                                                                                            |
| Bridge ID                       | The Bridge ID of this Bridge instance.                                                                                                                                                                                                                        |
| Root ID                         | The Bridge ID of the currently elected root bridge.                                                                                                                                                                                                           |
| Root Port                       | The switch port currently assigned the root port role.                                                                                                                                                                                                        |
| Root Cost                       | Root Path Cost. For the Root Bridge it is zero. For all other Bridges, it is the sum of the Port Path Costs on the least cost path to the Root Bridge                                                                                                         |
| Regional Root                   | The Bridge ID of the currently elected regional root bridge, inside the MSTP region of this bridge. (For the CIST instance only).                                                                                                                             |
| Internal Root Cost              | The Regional Root Path Cost. For the Regional Root Bridge this is zero. For all other CIST instances in the same MSTP region, it is the sum of the Internal Port Path Costs on the least cost path to the Internal Root Bridge. (For the CIST instance only). |
| Topology Flag                   | The current state of the Topology Change Flag of this Bridge instance.                                                                                                                                                                                        |
| Topology Change Count           | The number of times where the topology change flag has been set (during a one-second interval).                                                                                                                                                               |
| Topology Change Last            | The time passed since last Topology Flag was last set                                                                                                                                                                                                         |
| CIST Ports & Aggregations State |                                                                                                                                                                                                                                                               |
| Port                            | The switch port number of the logical STP port                                                                                                                                                                                                                |
| Port ID                         | The port id as used by the STP protocol. This is the priority part and the logical port index of the bridge port.                                                                                                                                             |

|                |                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Role           | The current STP port role. The port role can be one of the following values:<br><b>Alternate Port</b><br><b>BackupPortRootPort</b><br><b>Designated Port</b>                                                                                                                                               |
| State          | The current STP port state. The port state can be one of the following values:<br><b>Discarding</b><br><b>Learning</b><br><b>Forwarding</b>                                                                                                                                                                |
| Path Cost      | The current STP port path cost. This will either be a value computed from the <b>Auto</b> setting, or any explicitly configured value                                                                                                                                                                      |
| Edge           | The current STP port (operational) Edge Flag. An Edge Port is a switch port to which no Bridges are attached. The flag may be automatically computed or explicitly configured. Each Edge Port transits directly to the Forwarding Port State, since there is no possibility of it participating in a loop. |
| Point-to-Point | The current STP port point-to-point flag. A point-to-point port connects to a non-shared LAN media. The flag may be automatically computed or explicitly configured. The point-to-point properties of a port affect how fast it can transit to STP state.                                                  |
| Uptime         | The time since the bridge port was last initialized.                                                                                                                                                                                                                                                       |

#### 4.15.7.3 STP Port Status

This section displays the STP CIST port status for physical ports switch.

**Web GUI: Monitor > Spanning Tree > Port Status**

#### STP Port Status

| Port | CIST Role      | CIST State | Uptime       |
|------|----------------|------------|--------------|
| 1    | Disabled       | Discarding | -            |
| 2    | Disabled       | Discarding | -            |
| 3    | Disabled       | Discarding | -            |
| 4    | Disabled       | Discarding | -            |
| 5    | Disabled       | Discarding | -            |
| 6    | Disabled       | Discarding | -            |
| 7    | Disabled       | Discarding | -            |
| 8    | Disabled       | Discarding | -            |
| 9    | Disabled       | Discarding | -            |
| 10   | Disabled       | Discarding | -            |
| 11   | Disabled       | Discarding | -            |
| 12   | Disabled       | Discarding | -            |
| 13   | Disabled       | Discarding | -            |
| 14   | Disabled       | Discarding | -            |
| 15   | Disabled       | Discarding | -            |
| 16   | Disabled       | Discarding | -            |

|-------------------|----------------------------------------------------------------------------------------------|
| Port              | The switch port number of the logical STP port.                                              |
| MSTP              | The number of MSTP BPDU's received/transmitted on the port.                                  |
| RSTP              | The number of RSTP BPDU's received/transmitted on the port.                                  |
| STP               | The number of legacy STP Configuration BPDU's received/transmitted on the port.              |
| TCN               | The number of (legacy) Topology Change Notification BPDU's received/transmitted on the port. |
| Discarded Unknown | The number of unknown Spanning Tree BPDU's received (and discarded) on the port.             |
| Discarded Illegal | The number of illegal Spanning Tree BPDU's received (and discarded) on the port.             |

## 4.16 IP Multicast

Multicast is the delivery of information to a group of destinations simultaneously using the most efficient strategy to deliver the messages over each link of the network only once, creating copies only when the links to the destinations split.

Internet Group Management Protocol (IGMP) is an IP (Layer 3) protocol used for signaling of multicast group membership (adding or removing clients to/from a multicast group).

IGMP snooping analyze all IGMP packets between hosts connected to the R Class series and multicast routers in the network. When the R Class series snoops an IGMP Join or IGMP Report from a host for a given multicast group, it adds the host's port number to the multicast list for that group. When the R Class series snoops an IGMP Leave, it removes the host's port from the table entry.

The following sections explain and demonstrate in detail IGMP snooping support using the Web screens description.

### 4.16.1 IGMP Snooping Configuration

IGMP is an acronym for Internet Group Management Protocol. It is a communications protocol used to manage the membership of Internet Protocol multicast groups. IGMP is used by IP hosts and adjacent multicast routers to establish multicast group memberships. It is an integral part of the IP multicast specification, like ICMP for unicast connections. IGMP can be used for online video and gaming and allows more efficient use of resources when supporting these uses.

IPMC is an acronym for **IP** MultiCast.

IPMC supports IPv4 and IPv6 multicasting. IPMCv4 denotes multicast for IPv4. IPMCv6 denotes multicast for IPv6.

This section enables IGMP Snooping related configuration.

**Web GUI: Configuration > IPMC > IGMP Snooping > Basic Configuration**

**IGMP Snooping Configuration**

**Table 4-135: IGMP Snooping Configuration Parameters**

| Global Configuration                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Snooping Enabled                     | Enables the Global IGMP Snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Unregistered IPMCv4 Flooding enabled | Enables unregistered IPMCv4 traffic flooding. The flooding control takes effect only when IGMP Snooping is enabled. When IGMP Snooping is disabled, unregistered IPMCv4 traffic flooding is always active despite this setting.                                                                                                                                                                                                                                                                                                                                             |
| IGMP SSM Range                       | SSM (Source-Specific Multicast) Range allows the SSM-aware hosts and routers run the SSM service model for the groups in the address range.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Leave Proxy Enabled                  | Enables IGMP Leave Proxy. This feature can be used to avoid forwarding unnecessary leave messages to the router side.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Proxy Enabled                        | Enable IGMP Proxy. This feature can be used to avoid forwarding unnecessary join and leave messages to the router side.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Port Related Configuration           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Router Port                          | Specify which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or IGMP querier.<br><br>If an aggregation member port is selected as a router port, the whole aggregation will act as a router port.                                                                                                                                                                                                                                                                                                |
| Fast Leave                           | Enables the fast leave on the port.<br><br>Multicast snooping Fast Leave processing allows the switch to remove an interface from the forwarding-table entry without first sending out group specific queries to the interface.<br><br>The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Fast-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are in use simultaneously.<br><br>This processing applies to IGMP and MLD. |
| Throttling                           | Enable to limit the number of multicast groups to which a switch port can belong.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 4.16.2 IGMP Snooping VLAN Configuration

### Navigating the IGMP Snooping VLAN Table

Each page shows up to 99 entries from the VLAN table, default being 20, selected through the **entries per page** input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The **VLAN** input fields allow the user to select the starting point in the VLAN Table. Clicking the **Refresh** button will update the displayed table starting from that or the next closest VLAN Table match.

The >> will use the last entry of the currently displayed entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

**Web GUI: Configuration > IPMC > VLAN Configuration**

**Figure 4-142: IGMP Snooping VLAN Configuration**

**Table 4-136: IGMP Snooping VLAN Configuration Parameters**

|                  |                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID          | The VLAN ID of the entry.                                                                                                                                                                                                                                                                                                                                                                                  |
| Snooping Enabled | Enable the per-VLAN IGMP Snooping. Up to 32 VLANs can be selected for IGMP Snooping.                                                                                                                                                                                                                                                                                                                       |
| Querier Election | Enable to join IGMP Querier election in the VLAN. A router sends IGMP Query messages onto a particular link. This router is called the Querier.                                                                                                                                                                                                                                                            |
| Querier Address  | Define the IPv4 address as source address used in IP header for IGMP Querier election. When the Querier address is not set, system uses IPv4 management address of the IP interface associated with this VLAN. When the IPv4 management address is not set, system uses the first available IPv4 management address. Otherwise, system uses a pre-defined value. By default, this value will be 192.0.2.1. |
| Compatibility    | Compatibility is maintained by hosts and routers taking appropriate actions depending on the versions of IGMP operating on hosts and routers within a network.<br><br>The allowed selection is <b>IGMP-Auto</b> , <b>Forced IGMPv1</b> , <b>Forced IGMPv2</b> , <b>Forced IGMPv3</b> , default compatibility value is <b>IGMP-Auto</b> .                                                                   |
| PRI              | Priority of Interface. It indicates the IGMP control frame priority level generated by the system. These values can be used to prioritize different classes of traffic. The allowed range is <b>0</b> (best effort) to <b>7</b> (highest), default interface priority value is 0.                                                                                                                          |
| RV               | <b>Robustness Variable</b> . The Robustness Variable allows tuning for the expected packet loss on a network. The allowed range is <b>1</b> to <b>255</b> , default robustness variable value is 2.                                                                                                                                                                                                        |
| QI               | <b>Query Interval</b> . The Query Interval is the interval between General Queries sent by the Querier. The allowed range is <b>1</b> to <b>31744</b> seconds, default query interval is 125 seconds.                                                                                                                                                                                                      |
| QRI              | <b>Query Response Interval</b> . The Maximum Response Delay used to calculate the Maximum Response Code inserted into the periodic General Queries. The allowed range is <b>0</b> to <b>31744</b> in tenths of seconds, default query response interval is 100 in tenths of seconds (10 seconds).                                                                                                          |

|                      |                                                                                                                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LLQI (LMQI for IGMP) | <b>Last Member Query Interval.</b> The Last Member Query Time is the time value represented by the Last Member Query Interval, multiplied by the Last Member Query Count. The allowed range is <b>0</b> to <b>31744</b> in tenths of seconds, default last member query interval is 10 in tenths of seconds (1 second). |
| URI                  | <b>Unsolicited Report Interval.</b> The Unsolicited Report Interval is the time between repetitions of a host's initial report of membership in a group. The allowed range is <b>0</b> to <b>31744</b> seconds, default unsolicited report interval is 1 second.                                                        |
| Buttons              | <b>Add New IGMP VLAN:</b> Click to add new IGMP VLAN. Specify the VID and configure the new entry. Click "Save". The specific IGMP VLAN starts working after the corresponding static VLAN is also created.                                                                                                             |

*Note: by clicking on "Add New IGMP VLAN", we get the following display:*

IGMP Snooping VLAN Configuration Refresh |<< >>

Start from VLAN  with  entries per page.

| VLAN ID | Snooping Enabled         | Querier Election                    | Querier Address | Compatibility | PRI | RV | QI (sec) | QRI (0.1 sec) | LLQI (0.1 sec) | URI (sec) |
|---------|--------------------------|-------------------------------------|-----------------|---------------|-----|----|----------|---------------|----------------|-----------|
| 1       | <input type="checkbox"/> | <input checked="" type="checkbox"/> | 0.0.0.0         | IGMP-Auto     | 0   | 2  | 125      | 100           | 10             | 1         |

Refer to previous table for terminology.

### 4.16.3 IGMP Snooping Port Group Filtering Configuration

Web GUI: Configuration > IPMC > IGMP Snooping > Port Filtering Profile

#### IGMP Snooping Port Filtering Profile Configuration

| Port | Filtering Profile |
|------|-------------------|
| 1    | - v               |
| 2    | - v               |
| 3    | - v               |
| 4    | - v               |
| 5    | - v               |
| 6    | - v               |
| 7    | - v               |
| 8    | - v               |
| 9    | - v               |
| 10   | - v               |
| 11   | - v               |
| 12   | - v               |
| 13   | - v               |
| 14   | - v               |
| 15   | - v               |
| 16   | - v               |
| 17   | - v               |
| 18   | - v               |
| 19   | - v               |
| 20   | - v               |
| 21   | - v               |

**Figure 4-143: IGMP Snooping Port Group Filtering Configuration**

**Table 4-137: IGMP Snooping Port Group Filtering Configuration Parameters**

|                           |                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                      | The logical port for the settings.                                                                                                                                                                                                                                                                                       |
| Filtering Profile         | Select the <b>IPMC Profile</b> as the filtering condition for the specific port. Summary about the designated profile will be shown by clicking the view button. IP Multicast Profile is an acronym for <b>IP MultiCast Profile</b> . IP Multicast Profile is used to deploy the access control on IP multicast streams. |
| Profile Management Button | You can inspect the rules of the designated profile by using the following button:<br> : List the rules associated with the designated profile.                                                                                         |

### 4.16.4 IGMP Snooping Status

This section provides IGMP Snooping status.

**Web GUI: Configuration > IPMC > IGMP Snooping > Status**

**IGMP Snooping Status** Auto-refresh

Statistics

| VLAN ID | Querier Version | Host Version | Querier Status | Queries Transmitted | Queries Received | V1 Reports Received | V2 Reports Received | V3 Reports Received | V2 Leaves Received |
|---------|-----------------|--------------|----------------|---------------------|------------------|---------------------|---------------------|---------------------|--------------------|
|---------|-----------------|--------------|----------------|---------------------|------------------|---------------------|---------------------|---------------------|--------------------|

Router Port

| Port | Status |
|------|--------|
| 1    | -      |
| 2    | -      |
| 3    | -      |
| 4    | -      |
| 5    | -      |
| 6    | -      |
| 7    | -      |
| 8    | -      |

| <b>Router Port</b>                                                                                                                                                                                                                                                                                                                                                       |                                                         |
| Display which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or IGMP querier. Static denotes the specific port is configured to be a router port. Dynamic denotes the specific port is learnt to be a router port. Both denote the specific port is configured or learnt to be a router port. |                                                         |
| Port                                                                                                                                                                                                                                                                                                                                                                     | Switch port number.                                     |
| Status                                                                                                                                                                                                                                                                                                                                                                   | Indicate whether specific port is a router port or not. |

### 4.16.5 IGMP Snooping Groups Information

Entries in the IGMP Group Table are shown on this section. The IGMP Group Table is sorted first by VLAN ID, and then by group.

#### Navigating the IGMP Group Table

Each page shows up to 99 entries from the IGMP Group table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the IGMP Group Table. The "Start from VLAN", and "group" input fields allow the user to select the starting point in the IGMP Group Table. Clicking the **Refresh** button will update the displayed table starting from that or the closest next IGMP Group Table match. In addition, the two input fields will – upon a button click – assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The >> will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

#### Web GUI: Configuration > IPMC > IGMP Snooping > Groups Information

**IGMP Snooping Group Information** Auto-refresh  Refresh << >>

Start from VLAN  and group address  with  entries per page.

|                 |        | Port Members |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------------|--------|--------------|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|
| VLAN ID         | Groups | 1            | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 |
| No more entries |        |              |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |

Figure 4-145: IGMP Snooping Groups Information

**Table 4-139: IGMP Snooping Groups Parameters**

|              |                                       |
|--------------|---------------------------------------|
| VLAN ID      | VLAN ID of the group.                 |
| Groups       | Group address of the group displayed. |
| Port Members | Ports under this group.               |

### 4.16.6 IGMP SFM Information

Entries in the IGMP SFM Information Table are shown on this section. The IGMP SFM (Source-Filtered Multicast) Information Table also contains the SSM (Source-Specific Multicast) information. This table is sorted first by VLAN ID, then by group, and then by Port. Different source addresses belonging to the same group are treated as single entry.

#### Navigating the IGMP SFM Information Table

Each page shows up to 99 entries from the IGMP SFM Information table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the IGMP SFM Information Table. The "Start from VLAN", and "group" input fields allow the user to select the starting point in the IGMP SFM Information Table. Clicking **Refresh** the button will update the displayed table starting from that or the closest next IGMP SFM Information Table match. In addition, the two input fields will - upon a button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The >> will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

#### Web GUI: Configuration > IPMC > IGMP Snooping > IPv4 SFM Information

**IGMP SFM Information** Auto-refresh  Refresh |<< >>

Start from VLAN  and Group  with  entries per page.

| VLAN ID         | Group | Port | Mode | Source Address | Type | Hardware Filter/Switch |
|-----------------|-------|------|------|----------------|------|------------------------|
| No more entries |       |      |      |                |      |                        |

**Figure 4-146: IGMP SFM Information**

**Table 4-140: IGMP SFM Information Parameters**

|                |                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID        | VLAN ID of the group.                                                                                                                                                                                                             |
| Group          | Group address of the group displayed.                                                                                                                                                                                             |
| Port           | Switch port number.                                                                                                                                                                                                               |
| Mode           | Indicates the filtering mode maintained per (VLAN ID, port number, Group Address) basis. It can be either Include or Exclude.                                                                                                     |
| Source Address | IP Address of the source. Currently, system limits the total number of IPv4 source addresses for filtering (per group) is 8. When there is no any source filtering address, the text "None" is shown in the Source Address field. |
| Type           | Indicates the Type. It can be either Allow or Deny.                                                                                                                                                                               |

|                        |                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Hardware Filter/Switch | Indicates whether data plane destined to the specific group address from the source Ipv4 address could be handled by chip or not. |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------|

### 4.16.7 MLD Snooping Configuration

This section provides MLD Snooping related configuration.

**MLD is an acronym for Multicast Listener Discovery for Ipv6.** MLD is used by Ipv6 routers to discover multicast listeners on a directly attached link, much as IGMP is used in Ipv4. The protocol is embedded in ICMPv6 instead of using a separate protocol.

**Web GUI: Configuration > IPMC > MLD Snooping > Basic Configuration**

#### MLD Snooping Configuration

| Global Configuration                 |                                     |
|--------------------------------------|-------------------------------------|
| Snooping Enabled                     | <input checked="" type="checkbox"/> |
| Unregistered IPMCv6 Flooding Enabled | <input checked="" type="checkbox"/> |
| MLD SSM Range                        | ff3e:: / 96                         |
| Leave Proxy Enabled                  | <input type="checkbox"/>            |
| Proxy Enabled                        | <input type="checkbox"/>            |

#### Port Related Configuration

**Figure 4-147: MLD Snooping Configurations**

**Table 4-141: MLD Snooping Configurations Parameters**

| MLD Snooping Configuration |                                  |
|----------------------------|----------------------------------|
| Snooping Enabled           | Enables the Global MLD Snooping. |

|                                      |                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unregistered IPMCv6 Flooding enabled | Enables unregistered IPMCv6 traffic flooding.<br>The flooding control takes effect only when MLD Snooping is enabled.<br>When MLD Snooping is disabled, unregistered IPMCv6 traffic flooding is always active despite this setting                                                                     |
| MLD SSM Range                        | SSM (Source-Specific Multicast) Range allows the SSM-aware hosts and routers run the SSM service model for the groups in the address range.                                                                                                                                                            |
| Leave Proxy Enabled                  | Enables MLD Leave Proxy. This feature can be used to avoid forwarding unnecessary leave messages to the router side.                                                                                                                                                                                   |
| Proxy Enabled                        | Enable MLD Proxy. This feature can be used to avoid forwarding unnecessary join and leave messages to the router side.                                                                                                                                                                                 |
| <b>Port Related Configuration</b>    |                                                                                                                                                                                                                                                                                                        |
| Router Port                          | Specify which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or MLD querier.<br><br>If an aggregation member port is selected as a router port, the whole aggregation will act as a router port.                            |
| Fast Leave                           | Enable the fast leave on the port.<br><br>System will remove group record and stop forwarding data upon receiving the MLDv1 leave message without sending last member query messages.<br><br>It is recommended to enable this feature only when a single MLDv1 host is connected to the specific port. |
| Throttling                           | Enable to limit the number of multicast groups to which a switch port can belong.                                                                                                                                                                                                                      |

## 4.16.8 MLD Snooping VLAN Configuration

### Navigating the MLD Snooping VLAN Table

Each page shows up to 99 entries from the VLAN table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. Clicking the **Refresh** button will update the displayed table starting from that or the next closest VLAN Table match.

The >> will use the last entry of the currently displayed entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table.

Use << the button to start over.

**Web GUI: Configuration > IPMC > MLD Snooping > VLAN Configuration**

**Figure 4-148: MLD Snooping VLAN Configurations**

**Table 4-142: MLD Snooping VLAN Configuration Parameters**

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID              | The VLAN ID of the entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MLD Snooping Enabled | Enable the per-VLAN MLD Snooping. Up to <b>511</b> VLANs can be selected for MLD Snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Querier Election     | Enable the MLD <b>Querier election</b> in the VLAN. Disable to act as a MLD Non-Querier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Compatibility        | Compatibility is maintained by hosts and routers taking appropriate actions depending on the versions of MLD operating on hosts and routers within a network. The allowed selection is: <b>MLD-Auto, Forced MLD v1, Forced MLD v2</b> . Default compatibility value is <b>MLD-Auto</b> .                                                                                                                                                                                                                                                                                |
| PRI                  | Priority of Interface. It indicates the MLD control frame priority level generated by the system. These values can be used to prioritize different classes of traffic. The allowed range is <b>0</b> (best effort) to <b>7</b> (highest), default interface priority value is <b>0</b> .                                                                                                                                                                                                                                                                                |
| RV                   | <b>Robustness Variable</b> . The Robustness Variable allows tuning for the expected packet loss on a LINK. The allowed range is <b>1</b> to <b>255</b> , default robustness variable value is 2.                                                                                                                                                                                                                                                                                                                                                                        |
| QI                   | <b>Query Interval</b> . The Query Interval is the interval between General Queries sent by the Querier. The allowed range is <b>1</b> to <b>31744</b> seconds, default query interval is 125 seconds.                                                                                                                                                                                                                                                                                                                                                                   |
| QRI                  | <b>Query Response Interval</b> . The Maximum Response Delay used to calculate the Maximum Response Code inserted into the periodic General Queries. The allowed range is <b>0</b> to <b>31744</b> in tenths of seconds, default query response interval is 100 in tenths of seconds (10 seconds).                                                                                                                                                                                                                                                                       |
| LLQI                 | <b>Last Listener Query Interval</b> . The Last Listener Query Interval is the Maximum Response Delay used to calculate the Maximum Response Code inserted into Multicast Address Specific Queries sent in response to Version 1 Multicast Listener Done messages. It is also the Maximum Response Delay used to calculate the Maximum Response Code inserted into Multicast Address and Source Specific Query messages. The allowed range is <b>0</b> to <b>31744</b> in tenths of seconds, default last listener query interval is 10 in tenths of seconds (1 second). |
| URI                  | <b>Unsolicited Report Interval</b> . The Unsolicited Report Interval is the time between repetitions of a node's initial report of interest in a multicast address. The allowed range is <b>0</b> to <b>31744</b> seconds, default unsolicited report interval is 1 second.                                                                                                                                                                                                                                                                                             |

| Router Port                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                        |
| Display which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or MLD querier. Static denotes the specific port is configured to be a router port. Dynamic denotes the specific port is learnt to be a router port. Both denote the specific port is configured or learnt to be a router port. |                                                                                                                                        |
| Port                                                                                                                                                                                                                                                                                                                                                                    | Switch port number.                                                                                                                    |

|        |                                                         |
|--------|---------------------------------------------------------|
| Status | Indicate whether specific port is a router port or not. |
|--------|---------------------------------------------------------|

### 4.16.10 MLD Snooping Groups Information

Entries in the MLD Group Table are shown on this section

Navigating the MLD Group Table.

Each page shows up to 99 entries from the MLD Group table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MLD Group Table.

The "Start from VLAN", and "group" input fields allow the user to select the starting point in the MLD Group Table. Clicking the Refresh button will update the displayed table starting from that or the closest next MLD Group Table match. In addition, the two input fields will – upon a Refresh button click – assume the value of the first displayed entry, allowing for continuous refresh with the same start address

The >> will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

**Web GUI: Configuration > IPMC > MLD Snooping > Group Information**

**MLD Snooping Group Information** Auto-refresh  Refresh |<< >>

Start from VLAN  and group address  with  entries per page.

|                 |        | Port Members |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------------|--------|--------------|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|----|----|----|----|----|
| VLAN ID         | Groups | 1            | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 |
| No more entries |        |              |   |   |   |   |   |   |   |   |    |    |    |    |    |    |    |    |    |    |    |    |

**Figure 4-151: MLD Snooping Groups Information.**

**Table 4-145: MLD Snooping Groups Information Parameters**

|              |                                       |
|--------------|---------------------------------------|
| VLAN ID      | VLAN ID of the group.                 |
| Groups       | Group address of the group displayed. |
| Port Members | Ports under this group.               |

### 4.16.11 MLD SFM Information

Entries in the MLD SFM Information Table are shown on this page. The MLD SFM (Source-Filtered Multicast) Information Table also contains the SSM (Source-Specific Multicast) information. This table is sorted first by VLAN ID, then by group, and then by Port. Different source addresses belong to the same group are treated as single entry.

Navigating the MLD SFM Information Table

Each page shows up to 99 entries from the MLD SFM Information table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MLD SFM Information Table.

The "Start from VLAN", and "group" input fields allow the user to select the starting point in the MLD SFM Information Table. Clicking the Refresh button will update the displayed table starting from that or the closest next MLD SFM Information Table match. In addition, the two input fields will - upon a Refresh button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The >> will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << button to start over.

**Web GUI: Configuration > IPMC > MLD Snooping > IPv6 SFM Information**

**MLD SFM Information**

Start from VLAN  and Group  with  entries per page.

| VLAN ID         | Group | Port | Mode | Source Address | Type | Hardware Filter/Switch |
|-----------------|-------|------|------|----------------|------|------------------------|
| No more entries |       |      |      |                |      |                        |

Auto-refresh

**Figure 4-152: MLD SFM Information**

**Table 4-146: MLD SFM Information Parameters**

|                        |                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID                | VLAN ID of the group.                                                                                                             |
| Group                  | Group address of the group displayed.                                                                                             |
| Port                   | Switch port number.                                                                                                               |
| Mode                   | Indicates the filtering mode maintained per (VLAN ID, port number, Group Address) basis. It can be either Include or Exclude      |
| Source Address         | IP Address of the source. Currently, system limits the total number of IPv6 source addresses for filtering (per group) is 8.      |
| Type                   | Indicates the Type. It can be either Allow or Deny.                                                                               |
| Hardware Filter/Switch | Indicates whether data plane destined to the specific group address from the source IPv6 address could be handled by chip or not. |

## 4.17 Link Aggregation

LACP is an IEEE 802.3ad standard protocol. The Link Aggregation Control Protocol, allows bundling several physical ports together to form a single logical port.

Link aggregation bundles multiple ports (member ports) together into a single logical link. It is primarily used to increase available bandwidth without introducing loops in the network and to improve resiliency against faults. A link aggregation group (LAG) can be established with individual links being added or removed. This enables bandwidth to be incrementally scaled based on changing requirements. A link aggregation group can be quickly reconfigured if faults are identified.

Link aggregation (or IEEE 802.3ad) uses multiple Ethernet network links/ports in parallel to increase the link speed beyond the limits of any one single port, and to increase the redundancy for higher availability.

Two switches directly connected over several links can negotiate as to which ports should be selected as active members of an aggregation group.

A group of ports is selected to belong to a specific group ID (trunk) in order to generate an aggregated link.

Typically, the ports used in an aggregated link should be of the same type.

Link aggregation configuration is performed in two variants.

- Static – This mode is used to manually select the ports of the group.
- Link Aggregation Control Protocol (LACP) – In this mode two switches which are directly connected over several physical links, can negotiate which ports should be selected as active members of a group.

LACP works by sending frames (LACPDUs) down all links which have the protocol enabled. If it finds a device on the other end of the link which has also the LACP enabled, it will also independently send frames along the same links enabling the two devices to detect multiple links between themselves and the combine them into a single logical link.

### 4.17.1 Common Aggregation Configuration

The aggregation hash code contributor settings are global (hashes are calculated when the first connection is established and then kept in the device memory for the session lifetime).

**Web GUI: Configuration > Aggregation > Common**

#### Common Aggregation Configuration

| Hash Code Contributors  |                                     |
|-------------------------|-------------------------------------|
| Source MAC Address      | <input checked="" type="checkbox"/> |
| Destination MAC Address | <input type="checkbox"/>            |
| IP Address              | <input checked="" type="checkbox"/> |
| TCP/UDP Port Number     | <input checked="" type="checkbox"/> |

**Figure 4-153: Common Aggregation Configuration**

**Table 4-147: Common Aggregation Configuration Parameters**

| Aggregation Mode Configuration |                                                                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hash Code Contributors         |                                                                                                                                                                                                           |
| Source MAC Address             | The Source MAC ADDRESS can be used to calculate the destination port for the frame. Check to enable the use of the Source MAC address or uncheck to disable. By default, source MAC Address is “Enabled”. |
| Destination MAC Address        | Used to calculate the destination port for the frame. Check to enable the use of the Destination MAC Address or uncheck to disable. By default, destination MAC Address is “Disabled”.                    |
| <u>IP Address</u>              | The IP Address can be used to calculate the destination port for the frame. Check to enable the use of the IP Address or uncheck to disable. By default, IP Address is “Enabled”.                         |

|                            |                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TCP/UDP Port Number</b> | <p>The TCP/UDP port number can be used to calculate the destination port for the frame.</p> <p>Check to enable the use of the port number or uncheck to disable.</p> <p>By default, the port number is “Enabled”.</p> |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 4.17.2 Aggregation Group and Mode Configuration

R Class series allows set up of the Aggregation Mode Configuration and the Aggregation Group.

This section is used to configure the Aggregation hash mode and the aggregation group.

**Web GUI: Configuration > Aggregation > Groups**

### Aggregation Group Configuration

| Group ID | Port Members                     |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       | Group Configuration |                                     |            |
|----------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|---------------------|-------------------------------------|------------|
|          | 1                                | 2                                | 3                                | 4                                | 5                                | 6                                | 7                                | 8                                | 9                     | 10                    | 11                    | 12                    | 13                    | 14                    | 15                    | 16                    | 17                    | 18                    | 19                    | 20                    | 21                    | Mode                | Revertive                           | Max Bundle |
| Normal   | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |                     |                                     |            |
| 1        | <input checked="" type="radio"/> | <input checked="" type="radio"/> | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/>            | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | Static              | <input type="checkbox"/>            | 21         |

**Figure 4-154: Aggregation Group and Mode Configuration**

| Aggregation Group Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group ID                        | Indicates the group ID for the settings contained in the same row. Group ID "Normal" indicates there is no aggregation. Only one group ID is valid per port.                                                                                                                                                                                                                                                                                                                                                            |
| Port Members                    | Each switch port is listed for each group ID. Select a radio button to include a port in an aggregation or clear the radio button to remove the port from the aggregation. By default, no ports belong to any aggregation group. Only full duplex ports can join an aggregation and ports must be in the same speed in each group.                                                                                                                                                                                      |
| Mode                            | <p>This parameter determines the mode for the aggregation group.</p> <ul style="list-style-type: none"> <li>• <b>Disabled:</b> The group is disabled.</li> <li>• <b>Static:</b> The group operates in static aggregation mode.</li> <li>• <b>LACP (Active):</b> The group operates in LACP active aggregation mode. See IEEE 801.AX-2014, section 6.4.1 for details.</li> <li>• <b>LACP (Passive):</b> The group operates in LACP passive aggregation mode. See IEEE 801.AX-2014, section 6.4.1 for details.</li> </ul> |

|            |                                                                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Revertive  | This parameter only applies to LACP-enabled groups. It determines if the group will perform automatic link (re-)calculation when links with higher priority becomes available. |
| Max Bundle | This parameter only applies to LACP-enabled groups. It determines the maximum number of active bundled LACP ports allowed in an aggregation.                                   |

### 4.17.3 LACP Configuration

Figure 4-155: LACP Configuration

Table 4-148: LACP Port Parameters

|         |                                                                                                                                                                                                                                                                                                 |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port    | The switch port number.                                                                                                                                                                                                                                                                         |
| LACP    | Show whether LACP is currently enabled on this switch port.                                                                                                                                                                                                                                     |
| Timeout | The <b>Timeout</b> controls the period between BPDU transmissions. <b>Fast</b> will transmit LACP packets each second, while <b>Slow</b> will wait for 30 seconds before sending a LACP packet.                                                                                                 |
| Prio    | The <b>Prio</b> controls the priority of the port, range 1-65535. If the LACP partner wants to form a larger group than is supported by this device, then this parameter will control which ports will be active and which ports will be in a backup role. Lower number means greater priority. |

## 4.17.4 Aggregation Status

Web GUI: Monitor > Aggregation > Status

### Aggregation Status

| Aggr ID | Name  | Type        | Speed     | Configured Ports        | Aggregated Ports |
|---------|-------|-------------|-----------|-------------------------|------------------|
| 1       | LLAG1 | LACP_ACTIVE | Undefined | 10GigabitEthernet 1/1-2 | none             |

Figure 4-156: Aggregation Status

Table 4-149: Aggregation Status Parameters

| Aggregation Status |                                                               |
|--------------------|---------------------------------------------------------------|
| Aggr ID            | The Aggregation ID associated with this aggregation instance. |
| Name               | Name of the Aggregation group ID.                             |
| Type               | Type of the Aggregation group (Static or LACP).               |
| Speed              | Speed of the Aggregation group.                               |
| Configured ports   | Configured member ports of the Aggregation group.             |
| Aggregated ports   | Aggregated member ports of the Aggregation group.             |

## 4.17.5 LACP Monitoring

### 4.17.5.1 System Status

Web GUI: Monitor > Aggregation > LACP > System Status

#### LACP System Status

##### Local System ID

| Priority | MAC Address       |
|----------|-------------------|
| 32768    | 00-05-80-06-9a-80 |

##### Partner System Status

| Aggr ID | Partner System ID | Partner Prio | Partner Key | Last Changed | Local Ports |
|---------|-------------------|--------------|-------------|--------------|-------------|
| LLAG1   | 00-05-80-07-3c-a0 | 32768        | 1           | 0d 00:01:07  | 6,7         |

Figure 4-157: LACP System Status

Table 4-150: LACP System ID

| Local System ID                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------|
| This table display both the local system priority and the local system MAC address which forms the local LACP System ID. |

**Table 4-151: Partner System Status Parameters**

| Partner System Status                                                              |                                                                    |
|------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| This table display the partner system information for each LACP aggregation group. |                                                                    |
| Aggr ID                                                                            | The Aggregation ID associated with this aggregation instance.      |
| Partner System ID                                                                  | The system ID (MAC address) of the aggregation partner.            |
| Partner Prio                                                                       | The priority that the partner has assigned to this aggregation ID. |
| Partner Key                                                                        | The Key that the partner has assigned to this aggregation ID.      |
| Last changed                                                                       | The time since this aggregation changed.                           |
| Local Ports                                                                        | Shows which ports are a part of this aggregation for this switch.  |

### 4.17.5.2 Internal Status

**Web GUI: Monitor > Aggregation > LACP > Internal Status**

LACP Internal Port Status

| Port | State  | Key | Priority | Activity | Timeout | Aggregation | Synchronization | Collecting | Distributing | Defaulted | Expired |
|------|--------|-----|----------|----------|---------|-------------|-----------------|------------|--------------|-----------|---------|
| 6    | Active | 1   | 32768    | Active   | Fast    | Yes         | Yes             | Yes        | Yes          | No        | No      |
| 7    | Active | 1   | 32768    | Active   | Fast    | Yes         | Yes             | Yes        | Yes          | No        | No      |

**Figure 4-158: LACP Internal Status**

**Table 4-152: LACP Internal Status Parameters**

| Internal Status                                                                                                                                                                                                                 |                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| This page provides a status overview for the LACP internal (i.e. local system) status for all ports. Only ports that are part of an LACP group are shown. For details on the shown parameters please refer to IEEE 801.AX-2014. |                                                                                                                                                                                                       |
| Port                                                                                                                                                                                                                            | The switch port number.                                                                                                                                                                               |
| State                                                                                                                                                                                                                           | The current port state: <ul style="list-style-type: none"> <li>Down: The port is not active.</li> <li>Active: The port is in active state.</li> <li>Standby: The port is in standby state.</li> </ul> |
| Key                                                                                                                                                                                                                             | The key assigned to this port. Only ports with the same key can aggregate together.                                                                                                                   |
| Priority                                                                                                                                                                                                                        | The priority assigned to this aggregation group.                                                                                                                                                      |
| Activity                                                                                                                                                                                                                        | The LACP mode of the group (Active or Passive).                                                                                                                                                       |
| Timeout                                                                                                                                                                                                                         | The timeout mode configured for the port (Fast or Slow).                                                                                                                                              |
| Aggregation                                                                                                                                                                                                                     | Show whether the system considers this link to be "aggregateable"; i.e., a potential candidate for aggregation.                                                                                       |

|                 |                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synchronization | Show whether the system considers this link to be "IN_SYNC"; i.e., it has been allocated to the correct LAG, the group has been associated with a compatible Aggregator, and the identity of the LAG is consistent with the System ID and operational Key information transmitted. |
| Collecting      | Show if collection of incoming frames on this link is enabled.                                                                                                                                                                                                                     |
| Distributing    | Show if distribution of outgoing frames on this link is enabled.                                                                                                                                                                                                                   |
| Defaulted       | Show if the Actor's Receive machine is using Defaulted operational Partner information.                                                                                                                                                                                            |
| Expired         | Show if that the Actor's Receive machine is in the EXPIRED state.                                                                                                                                                                                                                  |

### 4.17.5.3 Neighbor Status

#### Web GUI: Monitor > Aggregation > LACP > Neighbor Status

LACP Neighbor Port Status

| Port | State  | Aggr ID | Partner Key | Partner Port | Partner Port Prio | Activity | Timeout | Aggregation | Synchronization | Collecting | Distributing | Defaulted | Expired |
|------|--------|---------|-------------|--------------|-------------------|----------|---------|-------------|-----------------|------------|--------------|-----------|---------|
| 6    | Active | 1       | 1           | 6            | 32768             | Active   | Fast    | Yes         | Yes             | Yes        | Yes          | No        | No      |
| 7    | Active | 1       | 1           | 7            | 32768             | Active   | Fast    | Yes         | Yes             | Yes        | Yes          | No        | No      |

Table 4-153: LACP Neighbor Status Parameters

| Neighbor Status                                                                                                                                                                                             |                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| This page provides a status overview for the LACP neighbor status for all ports. Only ports that are part of an LACP group are shown. For details on the shown parameters please refer to IEEE 801.AX-2014. |                                                                                                                                                                                                       |
| Port                                                                                                                                                                                                        | The switch port number.                                                                                                                                                                               |
| State                                                                                                                                                                                                       | The current port state: <ul style="list-style-type: none"> <li>Down: The port is not active.</li> <li>Active: The port is in active state.</li> <li>Standby: The port is in standby state.</li> </ul> |
| Aggr ID                                                                                                                                                                                                     | The aggregation group ID which the port is assigned to.                                                                                                                                               |
| Partner Key                                                                                                                                                                                                 | The key assigned to this port by the partner.                                                                                                                                                         |
| Partner Port                                                                                                                                                                                                | The partner port number associated with this link.                                                                                                                                                    |
| Partner Port Priority                                                                                                                                                                                       | The priority assigned to this partner port .                                                                                                                                                          |
| Activity                                                                                                                                                                                                    | The LACP mode of the group (Active or Passive).                                                                                                                                                       |
| Timeout                                                                                                                                                                                                     | The timeout mode configured for the port (Fast or Slow).                                                                                                                                              |
| Aggregation                                                                                                                                                                                                 | Show whether the system considers this link to be "aggregateable"; i.e., a potential candidate for aggregation.                                                                                       |

|                 |                                                                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synchronization | Show whether the system considers this link to be "IN_SYNC"; i.e., it has been allocated to the correct LAG, the group has been associated with a compatible Aggregator, and the identity of the LAG is consistent with the System ID and operational Key information transmitted. |
| Collecting      | Show if collection of incoming frames on this link is enabled.                                                                                                                                                                                                                     |
| Distributing    | Show if distribution of outgoing frames on this link is enabled.                                                                                                                                                                                                                   |
| Defaulted       | Show if the Actor's Receive machine is using Defaulted operational Partner information.                                                                                                                                                                                            |
| Expired         | Show if that the Actor's Receive machine is in the EXPIRED state.                                                                                                                                                                                                                  |

#### 4.17.5.4 Port Statistics

Web GUI: Monitor > Aggregation > LACP > Neighbor Status

##### LACP Statistics

| Port | LACP Received | LACP Transmitted | Discarded |         |
|------|---------------|------------------|-----------|---------|
|      |               |                  | Unknown   | Illegal |
| 6    | 3282          | 3282             | 0         | 0       |
| 7    | 3281          | 3282             | 0         | 0       |

Figure 4-160: LACP Neighbor Status

Table 4-154: LACP Neighbor Status Parameters

| Neighbor Status                                                   |                                                                                 |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------|
| This page provides an overview for LACP statistics for all ports. |                                                                                 |
| Port                                                              | The switch port number.                                                         |
| LACP Received                                                     | Shows how many LACP frames have been received at each port.                     |
| LACP Transmitted                                                  | Shows how many LACP frames have been sent from each port.                       |
| Discarded                                                         | Shows how many unknown or illegal LACP frames have been discarded at each port. |

## 4.18 LLDP-Link Discovery

**LLDP** is an IEEE 802.1ab standard protocol. The **Link Layer Discovery Protocol** is used for network discovery and works by having the units in the network exchanging information with their neighbors using LLDP frames.

Link discovery specifies a method and associated procedures that automatically discover transmission links and paths between network devices.

Unlike more traditional centralized polling techniques rooted in a management plane, autonomous link discovery procedures are rooted in and triggered by network elements composing the transport plane. As such, autonomous link discovery procedures may be event driven and executed in a coordinated, distributed fashion to automatically detect new link connectivity associations and correlate link endpoint attributes between these network elements.

Once successful link correlations have been determined, autonomous notifications of these correlated link associations are sent to management elements and/or control elements residing in their respective management and control plane domains.

Link Layer Discovery Protocol (LLDP) is a media independent protocol allowing the LLDP agent to learn higher-level management reachability and connection and point information from neighboring devices. Each configured device is an active LLDP agent that sends periodic messages to all physical interfaces that listen for LLDP messages.

LLDP monitoring is implemented by collecting both LLDP neighbor information and LLDP statistics.

### 4.18.1 LLDP Configuration

This section allows the user to inspect and configure the current LLDP port settings.

**Web GUI: Configuration > LLDP > LLDP**

#### LLDP Configuration

##### LLDP Parameters

|             |    |         |
|-------------|----|---------|
| Tx Interval | 30 | seconds |
| Tx Hold     | 4  | times   |
| Tx Delay    | 2  | seconds |
| Tx Reinit   | 2  | seconds |

##### LLDP Interface Configuration

| Interface              | Mode    | CDP aware                | Trap                     | Optional TLVs                       |                                     |                                     |                                     |                                     |
|------------------------|---------|--------------------------|--------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
|                        |         |                          |                          | Port Descr                          | Sys Name                            | Sys Descr                           | Sys Capa                            | Mgmt Addr                           |
| *                      | <>      | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| 10GigabitEthernet 1/1  | Enabled | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| 10GigabitEthernet 1/2  | Enabled | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |

**Figure 4-161: LLDP Configuration**

**Table 4-155: LLDP Configuration Parameters**

| LLDP Parameters              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tx Interval                  | The switch is periodically transmitting <b>LLDP</b> frames to its neighbors for having the network discovery information up to date. The interval between each LLDP frame is determined by the Tx Interval value. Valid values are restricted to 5 - 32768 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tx Hold                      | Each LLDP frame contains information about the length of time the information in the LLDP frame shall be considered valid. The LLDP information valid period is set to <b>Tx Hold</b> multiplied by <b>Tx Interval</b> seconds.<br><br>Valid values are restricted to 2 - 10 times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tx Delay                     | If some configuration is changed (e.g., the IP address) a new LLDP frame is transmitted, but the time between the LLDP frames will always be at least the value of <b>Tx Delay</b> in seconds. Tx Delay cannot be larger than a 1/4 of the <b>Tx Interval</b> value. Valid values are restricted to 1 - 8192 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Tx Reinit                    | When a port is disabled, LLDP is disabled or if the switch is rebooted, a LLDP shutdown frame is transmitted to the neighbor units for signaling that the LLDP information is not valid anymore. <b>Tx Reinit</b> controls the number of seconds between the shutdown frame and a new LLDP initialization. Valid values are restricted to 1 – 10 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LLDP Interface Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Interface                    | The switch interface name of the logical LLDP interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mode                         | Select the LLDP mode. <ul style="list-style-type: none"> <li>• <b>Rx only</b>: The switch will not send out LLDP information, but LLDP information from neighbor units is analyzed.</li> <li>• <b>Tx only</b>: The switch will drop LLDP information received from neighbors but will send out LLDP information.</li> <li>• <b>Disabled</b>: The switch will not send out LLDP information and will drop LLDP information received from neighbors.</li> <li>• <b>Enabled</b>: The switch will send out LLDP information and will analyze LLDP information received from neighbors.</li> </ul>                                                                                                                                                                             |
| CDP Aware                    | Select CDP awareness.<br><br>The CDP operation is restricted to decoding incoming CDP frames (The switch does not transmit CDP frames). CDP frames are only decoded if LLDP for the port is enabled.<br><br>Only CDP TLVs that can be mapped into a corresponding field in the LLDP neighbors table are decoded. All other TLVs are discarded (Unrecognized CDP TLVs and discarded CDP frame are not shown in the LLDP statistic). CDP TLVs are mapped into LLDP neighbors table as shown below.<br><br>CDP TLV "Device ID" is mapped into the LLDP "Chassis ID" field.<br><br>CDP TLV "Address" is mapped into the LLDP "Management Address" field. The CDP address TLV can contain multiple addresses, but only the first address is shown in the LLDP neighbors table. |

|                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                               | <p>CDP TLV "Port ID" is mapped into the LLDP "Port ID" field.</p> <p>CDP TLV "Version and Platform" is mapped into the LLDP "System Description" field.</p> <p>Both the CDP and LLDP supports "system capabilities", but the CDP capabilities cover capabilities that are not part of the LLDP. These capabilities are shown as "others" in the LLDP neighbors table. If all ports have CDP awareness disabled, the switch forwards CDP frames received from neighbor devices. If at least one port has CDP awareness enabled all CDP frames are terminated by the switch.</p> <hr/> <p><i>Notes:</i></p> <hr/> <hr/> <p><i>When CDP awareness for a port is disabled the CDP information isn't removed immediately but will be removed when the hold time is exceeded. CDP is an acronym for <u>C</u>isco <u>D</u>iscovery <u>P</u>rotocol.</i></p> <hr/> |
| <b>Optional TLVs</b>                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p>TLV is an acronym for Type Length Value. A LLDP frame can contain multiple pieces of information. Each of these pieces of information is known as TLV.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Fast start repeat count                                                                                                                                                                            | <p>Rapid startup and Emergency Call Service Location Identification Discovery of endpoints is a critically important aspect of VoIP systems in general. It is best to advertise only those pieces of information which are specifically relevant to particular endpoint types (for example only advertise the voice network policy to permitted voice-capable devices), both in order to conserve the limited LLDPDU space and to reduce security and system integrity issues that can come with inappropriate knowledge of the network policy.</p> <p>With this in mind LLDP-MED defines an LLDP-MED Fast Start interaction between the protocol and the application layers on top of the protocol, in order to achieve these related properties. Initially, a Network Connectivity Device will only transmit LLDP TLVs in an LLDPDU. Only after an LLDP-MED Endpoint Device is detected, will an LLDP-MED capable Network Connectivity Device start to advertise LLDP-MED TLVs in outgoing LLDPDUs on the associated port. The LLDP-MED application will temporarily speed up the transmission of the LLDPDU to start within a second, when a new LLDP-MED neighbor has been detected in order share LLDP-MED information as fast as possible to new neighbors.</p> <p>Because there is a risk of an LLDP frame being lost during transmission between neighbors', it is recommended to repeat the fast start transmission multiple times to increase the possibility of the neighbors' receiving the LLDP frame. With <b>Fast start repeat count</b> it is possible to specify the number of times the fast start transmission would be repeated. The recommended value is 4 times, given that 4 LLDP frames with a 1 second interval will be transmitted, when an LLDP frame with new information is received.</p> <p>It should be noted that LLDP-MED and the LLDP-MED Fast Start mechanism is only intended to run on links between LLDP-MED Network Connectivity Devices and Endpoint Devices, and as such does not apply to links between LAN infrastructure elements, including Network Connectivity Devices, or other types of links.</p> |
| LLDP Interface Configuration                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| It is possible to select which LLDP-MED information that shall be transmitted to the neighbors. When the checkbox is checked the information is included in the frame transmitted to the neighbor. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Emergency Call Service</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                              |
| <p><b>Emergency Call Service</b> ELIN identifier data format is defined to carry the ELIN identifier as used during emergency call setup to a traditional CAMA or ISDN trunk-based PSAP. This format consists of a numerical digit string, corresponding to the ELIN to be used for emergency calling.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                              |
| <b>Policies</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                              |
| <p>Network Policy Discovery enables the efficient discovery and diagnosis of mismatch issues with the VLAN configuration, along with the associated Layer 2 and Layer 3 attributes, which apply for a set of specific protocol applications on that port. Improper network policy configurations are a significant issue in VoIP environments that frequently result in voice quality degradation or loss of service.</p> <p><b>Policies</b> are only intended for use with applications that have specific 'real-time' network policy requirements, such as interactive voice and/or video services. The network policy attributes advertised are:</p> <ol style="list-style-type: none"> <li>1. Layer 2 VLAN ID (IEEE 802.1Q-2003).</li> <li>2. Layer 2 priority value (IEEE 802.1D-2004).</li> <li>3. Layer 3 Differentiated Services Code Point. (DSCP) value (IETF RFC 2474).</li> </ol> <p>This network policy is potentially advertised and associated with multiple sets of application types supported on a given port. The application types specifically addressed are:</p> <ul style="list-style-type: none"> <li>• Voice</li> <li>• Guest Voice</li> <li>• Softphone Voice</li> <li>• Video Conferencing</li> <li>• Streaming Video</li> <li>• 6. Control / Signaling (conditionally support a separate network policy for the media types above)</li> </ul> <p>A large network may support multiple VoIP policies across the entire organization, and different policies per application type. LLDP-MED allows multiple policies to be advertised per port, each corresponding to a different application type. Different ports on the same Network Connectivity Device may advertise different sets of policies, based on the authenticated user identity or port configuration.</p> |                                              |

|                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <p>It should be noted that LLDP-MED is not intended to run on links other than between Network Connectivity Devices and Endpoints, and therefore does not need to advertise the multitude of network policies that frequently run on an aggregated link interior to the LAN.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

This is auto generated and shall be used when selecting the polices that shall be mapped to the specific interfaces</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p>Application Type</p>                                                                                                                                                                                                                                                          | <p>Intended use of the application types:</p> <ol style="list-style-type: none"> <li>1. <b>Voice</b> - for use by dedicated IP Telephony handsets and other similar appliances supporting interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security by isolation from data applications.</li> <li>2. <b>Voice Signaling</b> (conditional) - for use in network topologies that require a different policy for the voice signaling than for the voice media. This application type should not be advertised if all the same network policies apply as those advertised in the <b>Voice</b> application policy.</li> <li>3. <b>Guest Voice</b> - support a separate 'limited feature-set' voice service for guest users and visitors with their own IP Telephony handsets and other similar appliances supporting interactive voice services.</li> <li>4. <b>Guest Voice Signaling</b> (conditional) - for use in network topologies that require a different policy for the guest voice signaling than for the guest voice media. This application type should not be advertised if all the same network policies apply as those advertised in the <b>Guest Voice</b> application policy.</li> <li>5. <b>Softphone Voice</b> - for use by softphone applications on typical data centric devices, such as PCs or laptops. This class of endpoints frequently does not support multiple VLANs, if at all, and are typically configured to use an 'untagged' VLAN or a single 'tagged' data specific VLAN. When a network policy is defined for use with an 'untagged' VLAN (see Tagged flag below), then the L2 priority field is ignored and only the DSCP value has relevance.</li> <li>6. <b>Video Conferencing</b> - for use by dedicated Video Conferencing equipment and other similar appliances supporting real-time interactive video/audio services.</li> <li>7. <b>Streaming Video</b> - for use by broadcast or multicast-based video content distribution and other similar applications supporting streaming video services that require specific network policy treatment. Video applications relying on TCP with buffering would not be an intended use of this application type.</li> <li>8. <b>Video Signaling</b> (conditional) - for use in network topologies that require a separate policy for the video signaling than for the video media. This application type should not be advertised if all the same network policies apply as those advertised in the <b>Video Conferencing</b> application policy.</li> </ol> |
| <p>Tag</p>                                                                                                                                                                                                                                                                       | <p><b>Tag</b> indicating whether the specified application type is using a 'tagged' or an 'untagged' VLAN.</p> <p><b>Untagged</b> indicates that the device is using an untagged frame format and as such does not include a tag header as defined by IEEE 802.1Q-2003. In this case, both the VLAN ID and the Layer 2 priority fields are ignored and only the DSCP value has relevance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                  | <b>Tagged</b> indicates that the device is using the IEEE 802.1Q tagged frame format, and that both the VLAN ID and the Layer 2 priority values are being used, as well as the DSCP value. The tagged format includes an additional field, known as the tag header. The tagged frame format also includes priority tagged frames as defined by IEEE 802.1Q-2003. |
| VLAN ID                                                                                                                                                                          | VLAN identifier (VID) for the port as defined in IEEE 802.1Q-2003.                                                                                                                                                                                                                                                                                               |
| L2 Priority                                                                                                                                                                      | <b>L2 Priority</b> is the Layer 2 priority to be used for the specified application type. <b>L2 Priority</b> may specify one of eight priority levels (0 through 7), as defined by IEEE 802.1D-2004. A value of 0 represents use of the default priority as defined in IEEE 802.1D-2004.                                                                         |
| DSCP                                                                                                                                                                             | <b>DSCP</b> value to be used to provide Diffserv node behavior for the specified application type as defined in IETF RFC 2474. <b>DSCP</b> may contain one of 64 code point values (0 through 63). A value of 0 represents use of the default DSCP value as defined in RFC 2475.                                                                                 |
| Adding a new policy                                                                                                                                                              | Click to <b>Add New Policy</b> . to add a new policy. Specify the <b>Application type, Tag, VLAN ID, L2 Priority</b> and <b>DSCP</b> for the new policy. Click "Save".<br><br>The number of policies supported is 32.                                                                                                                                            |
| <b>Policies Interface Configuration</b>                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                  |
| Every port may advertise a unique set of network policies or different attributes for the same network policies, based on the authenticated user identity or port configuration. |                                                                                                                                                                                                                                                                                                                                                                  |
| Interface                                                                                                                                                                        | The interface number to which the configuration applies.                                                                                                                                                                                                                                                                                                         |
| Policy Id                                                                                                                                                                        | The set of policies that shall apply to a given port. The set of policies is selected by check marking the checkboxes that corresponds to the policies.                                                                                                                                                                                                          |

By clicking on “Add new policy” the following display is shown:

**Web GUI: Configuration > LLDP > LLDP-MED | New Policy**

| Delete | Policy ID | Application Type | Tag    | VLAN ID | L2 Priority | DSCP |
|--------|-----------|------------------|--------|---------|-------------|------|
| Delete | 0         | Voice            | Tagged | 1       | 0           | 0    |

### 4.18.3 LLDP Monitoring

LLDP Monitoring is implemented by collecting:

- Neighbor
- LLDP-MED Neighbor
- EEE
- Port Statistics

#### 4.18.3.1 Neighbors

This page provides a status overview for all LLDP neighbors. The displayed table contains a row for each interface on which an LLDP neighbor is detected. The columns hold the following information:

**Web GUI: Monitor > LLDP > Neighbors**

LLDP Neighbor Information Auto-refresh  Refresh

| LLDP Remote Device Summary |                   |         |                  |             |                     |                    |
|----------------------------|-------------------|---------|------------------|-------------|---------------------|--------------------|
| Local Interface            | Chassis ID        | Port ID | Port Description | System Name | System Capabilities | Management Address |
| GigabitEthernet 1/1        | 02-00-C1-41-1C-F6 | 1       |                  |             |                     |                    |

**Table 4-157: LLDP Neighbor Information Parameters**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Interface     | The interface on which the LLDP frame was received.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Chassis ID          | The <b>Chassis ID</b> is the identification of the neighbor's LLDP frames.                                                                                                                                                                                                                                                                                                                                                                                                |
| Remote Port ID      | The <b>Remote Port ID</b> is the identification of the neighbor port.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Port Description    | <b>Port description</b> is the port description advertised by the 228 neighbor unit.                                                                                                                                                                                                                                                                                                                                                                                      |
| System Name         | <b>System name</b> is the name advertised by the neighbor unit.                                                                                                                                                                                                                                                                                                                                                                                                           |
| System Capabilities | Describes the 228 neighbor unit's capabilities. The possible capabilities are: <ul style="list-style-type: none"> <li>• Other</li> <li>• Repeater</li> <li>• Bridge</li> <li>• WLAN Access Point</li> <li>• Router</li> <li>• Telephone</li> <li>• DOCSIS cable device</li> <li>• Station only</li> <li>• Reserved</li> </ul> When a capability is "Enabled" – the capability is followed by (+).<br>When a capability is "Disabled" – the capability is followed by (-). |
| Management Address  | The neighbor unit's address used for higher layer entities to assist the discovery by the network management. This could for instance hold the neighbor's IP address.                                                                                                                                                                                                                                                                                                     |

**4.18.3.2 LLDP-MED Neighbour**

This section provides a status overview of all LLDP-MED neighbours. The displayed table contains a row for each port on which an LLDP neighbor is detected. This function applies to VoIP devices which support LLDP-MED. The columns hold the following information:

**Web GUI: Monitor > LLDP > LLDP-MED Neighbors**

LLDP-MED Neighbor Information Auto-refresh  Refresh

| Local Interface                        |
|----------------------------------------|
| No LLDP-MED neighbor information found |

**Figure 4-165: LLDP MED - Neighbour Information**

**Table 4-158: LLDP MED Neighbour Parameters**

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Interface   | The port on which the LLDP frame was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Device Type | <p>LLDP-MED Devices are comprised of two primary <b>Device Types</b>: Network Connectivity Devices and Endpoint Devices.</p> <p><b>LLDP-MED Network Connectivity Device Definition</b><br/> LLDP-MED Network Connectivity Devices, as defined in TIA-1057, provide access to the IEEE 802 based LAN infrastructure for LLDP-MED Endpoint Devices. An LLDP-MED Network Connectivity Device is a LAN access device based on any of the following technologies:</p> <ul style="list-style-type: none"> <li>• LAN Switch/Router</li> <li>• IEEE 802.1 Bridge</li> <li>• IEEE 802.3 Repeater (included for historical reasons)</li> <li>• IEEE 802.11 Wireless Access Point</li> <li>• Any device that supports the IEEE 802.1AB and MED extensions defined by TIA-1057 and can relay IEEE 802 frames via any method</li> </ul> <p><b>LLDP-MED Endpoint Device Definition</b></p> <p>LLDP-MED Endpoint Devices, as defined in TIA-1057, are located at the IEEE 802 LAN network edge, and participate in IP communication service using the LLDP-MED framework.</p> <p>Within the LLDP-MED Endpoint Device category, the LLDP-MED scheme is broken into further Endpoint Device Classes, as defined in the following.</p> <p>Each LLDP-MED Endpoint Device Class is defined to build upon the capabilities defined for the previous Endpoint Device Class. For-example will any LLDP-MED Endpoint Device claiming compliance as a Media Endpoint (Class II) also support all aspects of TIA-1057 applicable to Generic Endpoints (Class I), and any LLDP-MED Endpoint Device claiming compliance as a Communication Device (Class III) will also support all aspects of TIA-1057 applicable to both Media Endpoints (Class II) and Generic Endpoints (Class I).</p> <p><b>LLDP-MED Generic Endpoint (Class I)</b></p> <p>The LLDP-MED Generic Endpoint (Class I) definition is applicable to all endpoint products that require the base LLDP discovery services defined in TIA-1057, however do not support IP media or act as an end-user communication appliance. Such devices may include (but are not limited to) IP Communication Controllers, other communication related servers, or any device requiring basic services as defined in TIA-1057.</p> <p>Discovery services defined in this class include LAN configuration, device location, network policy, power management, and inventory management.</p> <p><b>LLDP-MED Media Endpoint (Class II)</b></p> <p>The LLDP-MED Media Endpoint (Class II) definition is applicable to all endpoint products that have IP media capabilities however may or may not be associated with a particular end user. Capabilities include all of the capabilities defined for the previous Generic Endpoint Class (Class I) and are extended to include aspects related to media streaming. Example product categories expected to</p> |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                              | <p>adhere to this class include (but are not limited to) Voice / Media Gateways, Conference Bridges, Media Servers, and similar.</p> <p>Discovery services defined in this class include media-type-specific network layer policy discovery.</p> <p><b>LLDP-MED Communication Endpoint (Class III)</b></p> <p>The LLDP-MED Communication Endpoint (Class III) definition is applicable to all endpoint products that act as end user communication appliances supporting IP media. Capabilities include all of the capabilities defined for the previous Generic Endpoint (Class I) and Media Endpoint (Class II) classes and are extended to include aspects related to end user devices. Example product categories expected to adhere to this class include (but are not limited to) end user communication appliances, such as IP Phones, PC-based softphones, or other communication appliances that directly support the end user.</p> <p>Discovery services defined in this class include provision of location identifier (including ECS / E911 information), embedded L2 switch support, inventory management.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p>LLDP-MED Capabilities</p> | <p><b>LLDP-MED Capabilities</b> describes the neighbor unit's LLDP-MED capabilities. The possible capabilities are:</p> <ul style="list-style-type: none"> <li>• LLDP-MED capabilities</li> <li>• Network Policy</li> <li>• Location Identification</li> <li>• Extended Power via MDI – PSE</li> <li>• Extended Power via MDI – PD</li> <li>• Inventory</li> <li>• Reserved</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p>Application Type</p>      | <p><b>Application Type</b> indicating the primary function of the application(s) defined for this network policy, advertised by an Endpoint or Network Connectivity Device. The possible application types are shown below.</p> <ul style="list-style-type: none"> <li>• <b>Voice</b> - for use by dedicated IP Telephony handsets and other similar appliances supporting interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security by isolation from data applications.</li> <li>• <b>Voice signaling</b> - for use in network topologies that require a different policy for the voice signaling than for the voice media.</li> <li>• <b>Guest Voice</b> - to support a separate limited feature-set voice service for guest users and visitors with their own IP Telephony handsets and other similar appliances supporting interactive voice services.</li> <li>• <b>Guest Voice Signaling</b> - for use in network topologies that require a different policy for the guest voice signalling than for the guest voice media.</li> <li>• <b>Softphone Voice</b> - for use by softphone applications on typical data centric devices, such as PCs or laptops.</li> <li>• <b>Video Conferencing</b> - for use by dedicated Video Conferencing equipment and other similar appliances supporting real-time interactive video/audio services.</li> <li>• <b>Streaming Video</b> - for use by broadcast or multicast-based video content distribution and other similar applications supporting streaming video</li> </ul> |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | <p>services that require specific network policy treatment. Video applications relying on TCP with buffering would not be an intended use of this application type.</p> <ul style="list-style-type: none"> <li>• <b>Video Signaling</b> - for use in network topologies that require a separate policy for the video signaling than for the video media.</li> </ul>                                         |
| Policy                        | <p><b>Policy</b> indicates that an Endpoint Device wants to explicitly advertise that the policy is required by the device. Can be either Defined or Unknown.</p> <p>Unknown: The network policy for the specified application type is currently unknown.</p> <p>Defined: The network policy is defined.</p>                                                                                                |
| TAG                           | <p><b>TAG</b> is indicative of whether the specified application type is using a tagged or an untagged VLAN. Can be Tagged or Untagged.</p> <p><b>Untagged:</b> The device is using an untagged frame format and as such does not include a tag header as defined by IEEE 802.1Q-2003.</p> <p><b>Tagged:</b> The device is using the IEEE 802.1Q tagged frame format.</p>                                   |
| VLAN ID                       | <p><b>VLAN ID</b> is the VLAN identifier (VID) for the port as defined in IEEE 802.1Q-2003. A value of 1 through 4094 is used to define a valid VLAN ID. A value of 0 (Priority Tagged) is used if the device is using priority tagged frames as defined by IEEE 802.1Q-2003, meaning that only the IEEE 802.1D priority level is significant and the default PVID of the ingress port is used instead.</p> |
| Priority                      | <p><b>Priority</b> is the Layer 2 priority to be used for the specified application type. One of the eight priority levels (0 through 7).</p>                                                                                                                                                                                                                                                               |
| DSCP                          | <p><b>DSCP</b> is the DSCP value to be used to provide Diffserv node behavior for the specified application type as defined in IETF RFC 2474. Contain one of 64 code point values (0 through 63).</p>                                                                                                                                                                                                       |
| Auto-negotiation              | <p><b>Auto-negotiation</b> identifies if MAC/PHY auto-negotiation is supported by the link partner.</p>                                                                                                                                                                                                                                                                                                     |
| Auto-negotiation status       | <p><b>Auto-negotiation status</b> identifies if auto-negotiation is currently enabled at the link partner. If <b>Auto-negotiation</b> is supported and <b>Auto-negotiation status</b> is disabled, the 802.3 PMD operating mode will be determined the operational MAU type field value rather than by auto-negotiation.</p>                                                                                |
| Auto-negotiation Capabilities | <p><b>Auto-negotiation Capabilities</b> shows the link partners MAC/PHY capabilities.</p>                                                                                                                                                                                                                                                                                                                   |

### 4.18.3.3 EEE

By using EEE power savings can be achieved at the expense of traffic latency. This latency occurs due to that the circuits EEE turn off to save power, need time to boot up before sending traffic over the link. This time is called "wakeup time". To achieve minimal latency, devices can use LLDP to exchange information about their respective tx and rx "wakeup time ", as a way to agree upon the minimum wakeup time they need.

EEE is an abbreviation for Energy Efficient Ethernet defined in IEEE 802.3az. This page provides an overview of EEE information exchanged by LLDP.

|                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>The displayed table contains a row for each interface. If the interface does not support EEE, then it displays as "EEE not supported for this interface". If EEE is not enabled on particular interface, then it displays as "EEE not enabled for this interface". If the link partner doesn't supports EEE, then it displays as "Link partner is not EEE capable. The columns hold the following information:</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Fallback Receive Tw                                                                                                                                                                                                                                                                                                                                                                                                   | <p>The link partner's fallbacks receive Tw.</p> <p>A receiving link partner may inform the transmitter of an alternate desired Tw_sys_tx. Since a receiving link partner is likely to have discrete levels for savings, this provides the transmitter with additional information that it may use for a more efficient allocation. Systems that do not implement this option default the value to be the same as that of the Receive Tw_sys_tx.</p>                                                                                                                                                                 |
| Echo Tx Tw                                                                                                                                                                                                                                                                                                                                                                                                            | <p>The link partner's fallback receives Tw. The respective echo values shall be defined as the local link partners reflection (echo) of the remote link partners respective values. When a local link partner receives its echoed values from the remote link partner it can determine whether the remote link partner has received, registered and processed its most recent values. For example, if the local link partner receives echoed parameters that do not match the values in its local MIB, then the local link partner infers that the remote link partners request was based on stale information.</p> |

### 4.18.3.4 Port Statistics

The R Class series unit provides an overview of all LLDP traffic. Two types of counters are shown: **Global counters** are counters that refer to the whole switch, while **local counters** (LLDP Statistics) refer to counters for the currently selected switch port.

| The displayed table contains a row for each interface. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Local Port                                             | The port on which LLDP frames are received or transmitted.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tx Frames                                              | The number of LLDP frames transmitted on the port.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Rx Frames                                              | The number of LLDP frames received on the port.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Rx Errors                                              | The number of received LLDP frames containing error.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Frames Discarded                                       | If an LLDP frame is received on a port, and the switch's internal table is full, the LLDP frame is counted and discarded. This situation is known as "Too Many Neighbors" in the LLDP standard. LLDP frames require a new entry in the table when <b>Chassis ID</b> or <b>Remote Port ID</b> is not already contained within the table. Entries are removed from the table when a given port link is down, an LLDP shutdown frame has been received, or when the entry ages out. |
| TLVs Discarded                                         | Each LLDP frame can contain multiple pieces of information, known as TLVs (Type Length Value). If a TLV is malformed, it is counted and discarded.                                                                                                                                                                                                                                                                                                                               |
| TLVs Unrecognized                                      | The number of well-formed TLVs, but with an unknown type of value.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Org. Discarded                                         | If LLDP frame is received with an organizationally TLV, but the TLV is not supported the TLV is discarded and counted.                                                                                                                                                                                                                                                                                                                                                           |
| Age-Outs                                               | Each <u>LLDP</u> frame contains information about how long the <u>LLDP</u> information is valid (age-out time).<br><br>If no new <u>LLDP</u> frame is received within the Age-Out time, the <u>LLDP</u> information is removed, and the <b>Age-Out Counter</b> is incremented.                                                                                                                                                                                                   |
| Clear                                                  | If checked the counters for the specific interface are cleared when is pressed.                                                                                                                                                                                                                                                                                                                                                                                                  |

## 4.19 Link OAM

The 802.3ah OAM standard provides the operation, administration and maintenance tools and mechanisms for monitoring link operation, fault detection and remote loopback control.

The 802.3ah is a complete standard for Ethernet in the first mile, which contains a link level (as opposed to service level) OAM mechanism. The protocol automatically discovers 802.3ah neighbors on a link. It can monitor and detect link degradation or failure in both bi-directional links and unidirectional links. Once a degradation or failure is detected, it provides diagnostic tools, e.g., it can set a link to "loopback" mode in order to check and isolate specific link problems.

The IEEE link layer OAM operates at the Ethernet layer and therefore (unlike SNMP or Ping) does not require an IP address.

The MIB variable retrieval operation allows collection of performance statistics.

The 802.3ah standard is a link oriented (port to port) protocol, i.e., it operates on a port level and communicates with the neighbor device directly connected to its port.

R Class series can communicate with any neighbor device supporting this protocol.

**The major capabilities of 802.3ah are:**

1. **Discovery:** detects the endpoints of a link and its OAM capabilities
2. **Remote Fault Detection:** allows one endpoint to convey severe events and failure conditions to its OAM link partner (Link fault, Dying Gasp, specific critical events)
3. **Link Performance Monitoring:** detection and notifications of different link faults. Event notification is delivered to the link partner when one of these events is detected on the link: Frame Error events, Frame Period Error events, Symbol Period Error events, Event Seconds Summary
4. **Remote Loopback:** can be used to put the remote port in loopback mode, useful for data-path test
5. **MIB variable retrieval:** collecting performance statistics. A MIB (Management Information Base) is a collection of variables which are deployed for measuring the link capability to support the defined SLA.
6. Verification of link port status
7. Simultaneous operation on multiple ports

A typical link OAM scenario is shown below:

**Figure 4-168: Sample Network with OAM functionality.**

### 4.19.1 Link OAM Port Configuration

This section allows the user to inspect the current Link OAM port configurations and change them as well.

Web GUI: Configuration > Link OAM > Port Settings

Link OAM Port Configuration

| Port             | The switch port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| OAM Enabled      | Controls whether Link OAM is enabled on this switch port. Enabling Link OAM provides the network operators the ability to monitor the health of the network and quickly determine the location of failing links or fault conditions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| OAM Mode         | <p>Configures the OAM Mode as Active or Passive. The default mode is Passive.</p> <p><b>Active mode</b></p> <p>DTE's configured in Active mode initiates the exchange of Information OAMPDUs as defined by the Discovery process. Once the Discovery process completes, Active DTE's are permitted to send any OAMPDU while connected to a remote OAM peer entity in Active mode. Active DTE's operates in a limited respect if the remote OAM entity is operating in Passive mode. Active devices should not respond to OAM remote loopback commands and variable requests from a Passive peer.</p> <p><b>Passive mode</b></p> <p>DTE's configured in Active mode initiates the exchange of Information OAMPDUs as defined by the Discovery process. Passive DTE's react to the initiation of the Discovery process by the remote DTE. This eliminates the possibility of passive-to-passive links. Passive DTE's shall not send Variable Request or Loopback Control OAMPDUs.</p> |
| Loopback Support | Controls whether the loopback support is enabled for the switch port. Link OAM remote loopback can be used for fault localization and link                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                       |                                                                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       | performance testing. Enabling the loopback support will allow the DTE to execute the remote loopback command that helps in the fault detection.                                                           |
| Link Monitor Support  | Controls whether the Link Monitor support is enabled for the switch port. On enabling the Link Monitor support, the DTE supports event notification that permits the inclusion of diagnostic information. |
| MIB Retrieval Support | Controls whether the MIB Retrieval Support is enabled for the switch port. On enabling the MIB retrieval support, the DTE supports polling of various Link OAM based MIB variables' contents.             |
| Loopback Operation    | If the Loopback support is enabled, enabling this field will start a loopback operation for the port.                                                                                                     |

### 4.19.2 Link Event Configuration for selected Port

This section allows the user to inspect the current Link OAM Link Event configurations and change them as well.

**Web GUI: Configuration > Link OAM > Events Settings**

**Link Event Configuration for Port 1** Port 1 ▾

| Event Name                | Error Window | Error Threshold |
|---------------------------|--------------|-----------------|
| Error Frame Event         | 1            | 1               |
| Symbol Period Error Event | 1            | 1               |
| Seconds Summary Event     | 60           | 1               |

**Table 4-162: Link Event Configuration for selected port Parameters**

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                      | The switch port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Event Name                | Name of the Link Event which is being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Error Window              | Represents the window period in the order of 1 sec for the observation of various link events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Error Threshold           | Represents the threshold value for the window period for the appropriate Link event so as to notify the peer of this error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Error Frame Event         | <p>The Errored Frame Event counts the number of errored frames detected during the specified period. The period is specified by a time interval (Window in order of 1 sec). This event is generated if the errored frame count is equal to or greater than the specified threshold for that period (Period Threshold).</p> <p>Errored frames are frames that had transmission errors as detected at the Media Access Control sublayer. Error Window for 'Error Frame Event' must be an integer value between 1-60 and its default value is '1'. Whereas Error Threshold must be between 0-0xffffffff and its default value is '0'.</p> |
| Symbol Period Error Event | Controls whether the MIB Retrieval Support is enabled for the switch port. On enabling the MIB retrieval support, the DTE supports polling of various Link OAM based MIB variables' contents.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Seconds Summary Event | <p>The Errored Frame Seconds Summary Event TLV counts the number of errored frame seconds that occurred during the specified period. The period is specified by a time interval. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period.</p> <p>An errored frame second is a one second interval wherein at least one frame error was detected. Errored frames are frames that had transmission errors as detected at the Media Access Control sublayer. Error Window for 'Seconds Summary Event' must be an integer value between 10-900 and its default value is '60'. Whereas Error Threshold must be between 0-0xffff and its default value is '1'.</p> |

### 4.19.3 Detailed Link OAM Statistics for selected port

This section provides detailed OAM traffic statistics for a specific switch port. Use the port select box to select which switch port details to display.

The displayed counters represent the total number of OAM frames received and transmitted for the selected port. Discontinuities of these counters can occur at re-initialization of the management system.

**Web GUI: Configuration > Link OAM > Events Settings**

**Detailed Link OAM Statistics for Port 1** Port 1 ▼ Auto-refresh  Refresh Clear

| Receive Total                         |   | Transmit Total                        |   |
|---------------------------------------|---|---------------------------------------|---|
| Rx OAM Information PDU's              | 0 | Tx OAM Information PDU's              | 0 |
| Rx Unique Error Event Notification    | 0 | Tx Unique Error Event Notification    | 0 |
| Rx Duplicate Error Event Notification | 0 | Tx Duplicate Error Event Notification | 0 |
| Rx Loopback Control                   | 0 | Tx Loopback Control                   | 0 |
| Rx Variable Request                   | 0 | Tx Variable Request                   | 0 |
| Rx Variable Response                  | 0 | Tx Variable Response                  | 0 |
| Rx Org Specific PDU's                 | 0 | Tx Org Specific PDU's                 | 0 |
| Rx Unsupported Codes                  | 0 | Tx Unsupported Codes                  | 0 |
| Rx Link Fault PDU's                   | 0 | Tx Link Fault PDU's                   | 0 |
| Rx Dying Gasp                         | 0 | Tx Dying Gasp                         | 0 |
| Rx Critical Event PDU's               | 0 | Tx Critical Event PDU's               | 0 |

| Receive Total and Transmit Total          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx and Tx OAM Information PDU's           | The number of received and transmitted OAM Information PDU's. Discontinuities of this counter can occur at re-initialization of the management system.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Rx and Tx Unique Error Event Notification | A count of the number of unique Event OAMPDU's received and transmitted on this interface. Event Notifications may be sent in duplicate to increase the probability of successfully being received, given the possibility that a frame may be lost in transit. Duplicate Event Notification transmissions are counted by Duplicate Event Notification counters for Tx and Rx respectively. A unique Event Notification OAMPDU is indicated as an Event Notification OAMPDU with a Sequence Number field that is distinct from the previously transmitted Event Notification OAMPDU Sequence Number. |

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx and Tx Duplicate Error Event Notification | A count of the number of duplicate Event OAMPDUs received and transmitted on this interface. Event Notification OAMPDUs may be sent in duplicate to increase the probability of successfully being received, given the possibility that a frame may be lost in transit. A duplicate Event Notification OAMPDU is indicated as an Event Notification OAMPDU with a Sequence Number field that is identical to the previously transmitted Event Notification OAMPDU Sequence Number. |
| Rx and Tx Loopback Control                   | A count of the number of Loopback Control OAMPDUs received and transmitted on this interface.                                                                                                                                                                                                                                                                                                                                                                                      |
| Rx and Tx Variable Request                   | A count of the number of Variable Request OAMPDUs received and transmitted on this interface.                                                                                                                                                                                                                                                                                                                                                                                      |
| Rx and Tx Variable Response                  | A count of the number of Variable Response OAMPDUs received and transmitted on this interface                                                                                                                                                                                                                                                                                                                                                                                      |
| Rx and Tx Org Specific PDU's                 | A count of the number of Organization Specific OAMPDUs transmitted on this interface.                                                                                                                                                                                                                                                                                                                                                                                              |
| Rx and Tx Unsupported Codes                  | A count of the number of OAMPDUs transmitted on this interface with an unsupported op-code.                                                                                                                                                                                                                                                                                                                                                                                        |
| Rx and Tx Link fault PDU's                   | A count of the number of Link fault PDU's received and transmitted on this interface.                                                                                                                                                                                                                                                                                                                                                                                              |
| Rx and Tx Dying Gasp                         | A count of the number of Dying Gasp events received and transmitted on this interface.                                                                                                                                                                                                                                                                                                                                                                                             |
| Rx and Tx Critical Event PDU's               | A count of the number of Critical event PDU's received and transmitted on this interface.                                                                                                                                                                                                                                                                                                                                                                                          |

#### 4.19.4 Detailed Link OAM Status for selected port

This page provides Link OAM configuration operational status. The displayed fields show the active configuration status for the selected port.

**Web GUI: Monitor > Link OAM > Port Status**

**Figure 4-172: Detailed Link OAM Status for selected port**

**Table 4-164: Detailed Link OAM Status for selected port Parameters**

| Local and Peer                       |                                                                                                                                                                                                                        |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                                 | The Mode in which the Link OAM is operating, Active or Passive.                                                                                                                                                        |
| Unidirectional Operation Support     | This feature is not available to be configured by the user. The status of this configuration is retrieved from the PHY.                                                                                                |
| Remote Loopback Support              | If status is enabled, DTE is capable of OAM remote loopback mode.                                                                                                                                                      |
| Link Monitoring Support              | If status is enabled, DTE supports interpreting Link Events.                                                                                                                                                           |
| MIB Retrieval Support                | If status is enabled DTE supports sending Variable Response OAMPDUs.                                                                                                                                                   |
| MTU Size                             | It represents the largest OAMPDU, in octets, supported by the DTE. This value is compared to the remotes Maximum PDU Size and the smaller of the two is used.                                                          |
| Multiplexer State                    | When in forwarding state, the Device is forwarding non-OAMPDUs to the lower sublayer. In case of discarding, the device discards all the non-OAMPDU's.                                                                 |
| Parser State                         | When in forwarding state, Device is forwarding non-OAMPDUs to higher sublayer. When in loopback, Device is looping back non-OAMPDUs to the lower sublayer. When in discarding state, Device is discarding non-OAMPDUs. |
| Organizational Unique Identification | 24-bit Organizationally Unique Identifier of the vendor.                                                                                                                                                               |
| PDU Revision                         | It indicates the current revision of the Information TLV. The value of this field shall start at zero and be incremented each time something in the Information TLV changes.                                           |
| PDU Permission                       | This field is available only for the Local DTE. It displays the current permission rules set for the local DTE. Possible values are "Link fault", "Receive only", "Information exchange only", "ANY".                  |
| Discovery State                      | Displays the current state of the discovery process. Possible states are Fault state, Active state, Passive state, SEND_LOCAL_REMOTE_STATE, SEND_LOCAL_REMOTE_OK_STATE, SEND_ANY_STATE.                                |

#### 4.19.5 Detailed Link OAM Link Events Status for selected port

This section allows the user to inspect the current Link OAM Link Event configurations and change them as well. The left pane displays the Event status for the Local OAM unit while the right pane displays the status for the Peer for the respective port.

Web GUI: Monitor > Link OAM > Event Status

Detailed Link OAM Link Status for Port 1

Port 1  Auto-refresh  Refresh

| Local Frame Error Status                    |   | Remote Frame Error Status                   |   |

Figure 4-173: Detailed Link OAM Link Status Events for selected port

Table 4-165: Link OAM Link Status Events for selected port Parameters

|                             |                                                                                                                                                                                                                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                        | The switch port number.                                                                                                                                                                                                                                                                     |
| Sequence Number             | This two-octet field indicates the total number of events occurred at the remote end.                                                                                                                                                                                                       |
| Frame Error Event Timestamp | This two-octet field indicates the time reference when the event was generated, in terms of 100 ms intervals.                                                                                                                                                                               |
| Frame error event window    | This two-octet field indicates the duration of the period in terms of 100 ms intervals. 1) The default value is one second. 2) The lower bound is one second. 3) The upper bound is one minute.                                                                                             |
| Frame error event threshold | This four-octet field indicates the number of detected errored frames in the period is required to be equal to or greater than in order for the event to be generated. 1) The default value is one frame error. 2) The lower bound is zero frame errors. 3) The upper bound is unspecified. |
| Frame errors                | This four-octet field indicates the number of detected errored frames in the period.                                                                                                                                                                                                        |
| Total frame errors          | This eight-octet field indicates the sum of errored frames that have been detected since the OAM sublayer was reset.                                                                                                                                                                        |

|                                             |                                                                                                                                                                                                           |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total frame error events                    | This four-octet field indicates the number of Errored Frame Event TLVs that have been generated since the OAM sublayer was reset.                                                                         |
| Frame Period Error Event Timestamp          | This two-octet field indicates the time reference when the event was generated, in terms of 100 ms intervals                                                                                              |
| Frame Period Error Event Window             | This four-octet field indicates the duration of period in terms of frames.                                                                                                                                |
| Frame Period Error Event Threshold          | This four-octet field indicates the number of errored frames in the period is required to be equal to or greater than in order for the event to be generated                                              |
| Frame Period Errors                         | This four-octet field indicates the number of frame errors in the period.                                                                                                                                 |
| Total frame period errors                   | This eight-octet field indicates the sum of frame errors that have been detected since the OAM sublayer was reset.                                                                                        |
| Total frame period error events             | This four-octet field indicates the number of Errored Frame Period Event TLVs that have been generated since the OAM sublayer was reset.                                                                  |
| Symbol Period Error Event Timestamp         | This two-octet field indicates the time reference when the event was generated, in terms of 100 ms intervals                                                                                              |
| Symbol Period Error Event Window            | This eight-octet field indicates the number of symbols in the period.                                                                                                                                     |
| Symbol Period Error Event Threshold         | This eight-octet field indicates the number of errored symbols in the period is required to be equal to or greater than in order for the event to be generated.                                           |
| Symbol Period Errors                        | This eight-octet field indicates the number of symbol errors in the period.                                                                                                                               |
| Total symbol period errors                  | This eight-octet field indicates the sum of symbol errors since the OAM sublayer was reset.                                                                                                               |
| Total Symbol period error events            | This four-octet field indicates the number of Errored Symbol Period Event TLVs that have been generated since the OAM sublayer was reset.                                                                 |
| Error Frame Seconds Summary Event Timestamp | This two-octet field indicates the time reference when the event was generated, in terms of 100 ms intervals, encoded as a 16-bit unsigned integer.                                                       |
| Error Frame Seconds Summary Event window    | This two-octet field indicates the duration of the period in terms of 100 ms intervals, encoded as a 16-bit unsigned integer.                                                                             |
| Error Frame Seconds Summary Event Threshold | This two-octet field indicates the number of errored frame seconds in the period is required to be equal to or greater than in order for the event to be generated, encoded as a 16-bit unsigned integer. |
| Error Frame Seconds Summary Errors          | This two-octet field indicates the number of errored frame seconds in the period, encoded as a 16-bit unsigned integer.                                                                                   |

|                                                 |                                                                                                                                                                                               |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Total Error Frame Seconds Summary Errors</p> | <p>This four-octet field indicates the sum of errored frame seconds that have been detected since the OAM sublayer was reset.</p>                                                             |
| <p>Total Error Frame Seconds Summary Events</p> | <p>This four-octet field indicates the number of Errored Frame Seconds Summary Event TLVs that have been generated since the OAM sublayer was reset, encoded as a 32bit unsigned integer.</p> |

## 4.20 RMON (Remote Network Monitoring)

### 4.20.1 RMON Statistics Configuration

Configure RMON Statistics table on this section. The entry index key is **ID**.

**Web GUI: Configuration > RMON > Statistics**

#### RMON Statistics Configuration

| Delete                   | ID                   | Data Source                                  |
|--------------------------|----------------------|----------------------------------------------|
| <input type="checkbox"/> | <input type="text"/> | .1.3.6.1.2.1.2.2.1.1. <input type="text"/> 0 |

**Figure 4-174: RMON Statistics Configuration**

**Table 4-166: RMON Statistics Configuration Parameters**

|             |                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete      | Check to delete the entry. It will be deleted during the next save.                                                                                                                    |
| ID          | Indicates the index of the entry. The range is from 1 to 65535.                                                                                                                        |
| Data Source | Indicates the port ID which wants to be monitored. If in stacking switch, the value must add 1000000*(switch ID-1), for example, if the port is switch 3 port 5, the value is 2000005. |

### 4.20.2 RMON History Configuration

Configure RMON History table on this section. The entry index key is **ID**.

**Web GUI: Configuration > RMON > History**

| General Settings Global Configuration |                                                           |
|---------------------------------------|-----------------------------------------------------------|
| Enable Loop Protection                | Controls whether Loop Protection is enabled (as a whole). |

|                           |                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmission Time         | The interval between each Loop Protection PDU sent on each port. valid values are 1 to 10 seconds. Default value is 5 seconds                                                                                                                                                                    |
| Shutdown Time             | The period (in seconds) for which a port will be kept disabled in the event of a loop is detected (and the port action shuts down the port). Valid values are 0 to 604800 seconds (7 days). A value of zero will keep a port disabled (until next device restart). Default value is 180 seconds. |
| <b>Port Configuration</b> |                                                                                                                                                                                                                                                                                                  |
| Port                      | The switch port number of the port.                                                                                                                                                                                                                                                              |
| Enable                    | Controls whether Loop Protection is enabled on this switch port.                                                                                                                                                                                                                                 |
| Action                    | Configures the action performed when a loop is detected on a port. Valid values are <b>Shutdown Port</b> , <b>Shutdown Port and Log</b> or <b>Log Only</b> .                                                                                                                                     |
| Tx Mode                   | Controls whether the port is actively generating Loop Protection PDU's, or whether it is just passively looking for looped PDU's.                                                                                                                                                                |

### 4.21.1 Loop Protection Status

This page displays the loop protection port status the ports of the switch.

Loop protection port status is:

#### Port

Web GUI: Monitor > Loop Protection

**Loop Protection Status** Auto-refresh  Refresh

| Port | Action   | Transmit | Loops | Status | Loop | Time of Last Loop |

|-------------------|---------------------------------------------------|
| Port              | The switch port number of the logical port.       |
| Action            | The currently configured port action.             |
| Transmit          | The currently configured port transmit mode.      |
| Loops             | The number of loops detected on this port.        |
| Status            | The current Loop Protection status of the port.   |
| Loop              | Whether a loop is currently detected on the port. |
| Time of Last Loop | The time of the last loop event detected.         |

## 4.22 GVRP Configuration

This section allows you to configure the global GVRP configuration settings that are commonly applied to all GVRP enabled ports. GVRP is an acronym for **G**ARP **V**LAN **R**egistration **P**rotocol. It is a protocol for dynamically registering VLANs on ports and is specified in IEEE 802.1Q-2005, clause 11. GVRP is an example of the use of GARP, hence the G in GVRP.

GARP is an acronym for **G**eneric **A**tttribute **R**egistration **P**rotocol. It is a generic protocol for registering attribute with other participants and is specified in IEEE 802.1D-2004, clause 12.

**Web GUI: Configuration > GVRP > Global config**

### GVRP Configuration

Enable GVRP

| Parameter      | Value |
|----------------|-------|
| Join-time:     | 20    |
| Leave-time:    | 60    |
| LeaveAll-time: | 1000  |
| Max VLANs:     | 20    |

|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable GVRP globally | The GVRP feature is globally enabled by setting the check mark in the checkbox named Enable GVRP and pressing the <b>Apply</b> button.                                                                                                                                                                                                                                                               |
| GVRP protocol timers | <p><b>Join-time</b> is a value in the range of 1-20cs, i.e., in units of one hundredth of a second. The default value is 20cs.</p> <p><b>Leave-time</b> is a value in the range of 60-300cs, i.e., in units of one hundredth of a second. The default is 60cs.</p> <p>Leave All-time is a value in the range of 1000-5000cs, i.e., in units of one hundredth of a second. The default is 1000cs.</p> |
| Max number of VLANs  | When GVRP is enabled, a maximum number of VLANs supported by GVRP is specified. By default, this number is 20. This number can only be changed when GVRP is turned off.                                                                                                                                                                                                                              |

## 4.23 sFlow Consideration

sFlow is an industry standard technology for monitoring switched networks through random sampling of packets on switch ports and time-based sampling of port counters. The sampled packets and counters (referred to as flow samples and counter samples, respectively) are sent as sFlow UDP datagrams to a central network traffic monitoring server. This central server is called an sFlow receiver or sFlow collector.

Additional information can be found at <http://sflow.org>.

### 4.23.1 sFlow Configuration displays

This sub-section allows configuring sFlow. The configuration is divided into two parts: Configuration of the sFlow receiver (a.k.a. sFlow collector) and configuration of per-port flow and counter samplers.

sFlow configuration is not persisted to non-volatile memory, which means that a reboot will disable sFlow sampling.

**Figure 4-181: sFlow Configuration displays****Table 4-173: sFlow Configuration display parameters**

This page allows for configuring [sFlow](#). The configuration is divided into two parts: Configuration of the sFlow receiver (a.k.a. sFlow collector) and configuration of per-port flow and counter samplers. sFlow configuration is not persisted to non-volatile memory, which means that a reboot will disable sFlow sampling.

| Agent Configuration    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address             | The IP address used as Agent IP address in sFlow datagrams. It serves as a unique key that will identify this agent over extended periods of time. Both IPv4 and IPv6 addresses are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Receiver Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Owner                  | <p>Basically, sFlow can be configured in two ways: Through local management using the Web or CLI interface or through SNMP. This read-only field shows the owner of the current sFlow configuration and assumes values as follows:</p> <ul style="list-style-type: none"> <li>• If sFlow is currently unconfigured/unclaimed, Owner contains &lt;none&gt;.</li> <li>• If sFlow is currently configured through Web or CLI, Owner contains &lt;Configured through local management&gt;.</li> <li>• If sFlow is currently configured through SNMP, Owner contains a string identifying the sFlow receiver.</li> </ul> <p>If sFlow is configured through SNMP, all controls - except for the Release-button - are disabled to avoid inadvertent reconfiguration.</p> <p>The <b>Release</b> button allows for releasing the current owner and disable sFlow sampling. The button is disabled if sFlow is currently unclaimed. If configured through SNMP, the release must be confirmed (a confirmation request will appear).</p> |
| IP Address/Hostname    | The IP address or hostname of the sFlow receiver. Both IPv4 and IPv6 addresses are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| UDP Port               | The UDP port on which the sFlow receiver listens to sFlow datagrams. If set to 0 (zero), the default port (6343) is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Timeout                | The number of seconds remaining before sampling stops and the current sFlow owner is released. While active, the current time left can be updated with a click on the Refresh-button. If locally managed, the timeout can be changed on the fly without affecting any other settings. Valid range is 0 to 2147483647 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Max. Datagram Size     | The maximum number of data bytes that can be sent in a single sample datagram. This should be set to a value that avoids fragmentation of the sFlow datagrams. Valid range is 200 to 1468 bytes with default being 1400 bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Port Configuration          |                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                        | The port number for which the configuration below applies.                                                                                                                                                                                                                                                                                                                                |
| Flow Sampler Enabled        | Enables/disables flow sampling on this port.                                                                                                                                                                                                                                                                                                                                              |
| Flow Sampler Sampling Rate: | The statistical sampling rate for packet sampling. Set to N to sample on average 1/Nth of the packets transmitted/received on the port.<br><br>Not all sampling rates are achievable. If an unsupported sampling rate is requested, the switch will automatically adjust it to the closest achievable. This will be reported back in this field. Valid range is 1 to 32767.               |
| Flow Sampler Max. Header    | The maximum number of bytes that should be copied from a sampled packet to the sFlow datagram. Valid range is 14 to 200 bytes with default being 128 bytes.<br><br>To have room for any frame, the maximum datagram size should be roughly 100 bytes larger than the maximum header size. If the maximum datagram size does not consider the maximum header size, samples may be dropped. |
| Counter Poller Enabled      | Enables/disables counter polling on this port.                                                                                                                                                                                                                                                                                                                                            |
| Counter Poller Interval     | With counter polling enabled, this specifies the interval - in seconds - between counter poller samples. Valid range is 1 to 3600 seconds.                                                                                                                                                                                                                                                |

### 4.23.2 sFlow Statistics

This sub-section shows receiver and per-port sFlow statistics.

#### Receiver Statistics

|                     |         |
|---------------------|---------|
| Owner               | <none>  |
| IP Address/Hostname | 0.0.0.0 |
| Timeout             | 0       |
| Tx Successes        | 0       |
| Tx Errors           | 0       |
| Flow Samples        | 0       |
| Counter Samples     | 0       |

#### Port Statistics

| Port | Flow Samples | Counter Samples |
|------|--------------|-----------------|
| 1    | 0            | 0               |
| 2    | 0            | 0               |
| ...  | ...          | ...             |
| 20   | 0            | 0               |
| 21   | 0            | 0               |

**Table 4-174: sFlow Statistics**

| <b>Receiver Statistics</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Owner.                     | This field shows the current owner of the sFlow configuration. It assumes one of three values as follows: <ul style="list-style-type: none"> <li>• If sFlow is currently unconfigured /unclaimed, Owner contains <b>&lt;None&gt;</b>.</li> <li>• If sFlow is currently configured through Web or CLI, Owner contains <b>&lt;Configured through local management&gt;</b>.</li> <li>• If sFlow is currently configured through SNMP, Owner contains a string identifying the sFlow receiver.</li> </ul> |
| IP Address / Hostname      | The IP address or hostname of the sFlow receiver                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Timeout                    | The number of seconds remaining before sampling stops and the current sFlow owner is released.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Tx Successes               | The number of UDP datagrams successfully sent to the sFlow receiver.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Tx Errors                  | The number of UDP datagrams that has failed transmission. The most common source of errors is invalid sFlow receiver IP/hostname configuration.<br><br>To diagnose, paste the receiver's IP address/hostname into the Ping Web page (Diagnostics → Ping/Ping6).                                                                                                                                                                                                                                       |
| Flow Sample                | The total number of flow samples sent to the sFlow receiver.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Counter Samples            | The total number of counter samples sent to the sFlow receiver.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Port Configuration</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Port                       | The port number for which the following statistics applies.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Flow Samples               | The number of flow samples sent to the sFlow receiver originating from this port.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Counter Samples            | The total number of counter samples sent to the sFlow receiver originating from this port.                                                                                                                                                                                                                                                                                                                                                                                                            |

## 4.24 UDLD Configuration

UDLD is an acronym for **U**ni **D**irectional **L**ink **D**etection. UDLD protocol monitors the physical configuration of the links between devices and ports that support UDLD. It detects the existence of unidirectional links. Its functionality is to provide mechanisms useful for detecting one-way connections before they create a loop or other protocol malfunction.

RFC 5171 specifies a way at data link layer to detect Uni directional link.

This section allows the user to inspect the current UDLD configurations, and possibly change them as well.

### 4.24.1 UDLD Port Configuration

Web GUI: Configuration > UDLD

#### UDLD Port Configuration

| Port | UDLD mode | Message Interval |
|------|-----------|------------------|
| *    | <>        | 7                |
| 1    | Disable   | 7                |
| 2    | Disable   | 7                |
| 3    | Disable   | 7                |
| 4    | Disable   | 7                |
| 5    | Disable   | 7                |
| 6    | Disable   | 7                |
| 7    | Disable   | 7                |
| 8    | Disable   | 7                |
| 9    | Disable   | 7                |
| 10   | Disable   | 7                |
| 11   | Disable   | 7                |
| 12   | Disable   | 7                |
| 13   | Disable   | 7                |
| 14   | Disable   | 7                |
| 15   | Disable   | 7                |
| 16   | Disable   | 7                |
| 17   | Disable   | 7                |
| 18   | Disable   | 7                |
| 19   | Disable   | 7                |
| 20   | Disable   | 7                |
| 21   | Disable   | 7                |

Apply Reset

**Figure 4-183: UDLD Port Configuration display**

**Table 4-175: UDLD Port Configuration parameters**

| UDLD Port Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port                    | Port number of the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| UDLD Mode               | Configure the UDLD mode on a port. Valid values are <b>Disable</b> , <b>Normal</b> and <b>Aggressive</b> . Default mode is <b>Disable</b> .<br><b>Disable</b> : In disabled mode, UDLD functionality doesn't exist on port.<br><b>Normal</b> : In normal mode, if the link state of the port was determined to be unidirectional, it will not affect the port state.<br><b>Aggressive</b> : In aggressive mode, unidirectional detected ports will get shutdown to bring back the ports up, need to disable UDLD on that port. |
| Message Interval        | Configures the period of time between UDLD probe messages on ports that are in the advertisement phase and are determined to be bidirectional. The range is from 7 to 90 seconds (Default value is 7 seconds) (Currently default time interval is supported, due to lack of detailed information in RFC 5171).                                                                                                                                                                                                                 |

### 4.24.2 Detailed UDLD Status for Port 1

This section displays the UDLD status of the selected port

**Web GUI: Configuration > UDLD**

#### Detailed UDLD Status for Port 1

| UDLD status         |                   |
|---------------------|-------------------|
| UDLD Admin state    | Disable           |
| Device ID(local)    | 00-05-80-00-83-DD |
| Device Name(local)  | Falcon-87         |
| Bidirectional State | Indeterminant     |

Port 1

**Figure 4-184: UDLD Status for Port 1**

**Table 4-176: UDLD Status for Port 1 parameters**

| UDLD Port Status    |                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| UDLD Admin State    | The current port state of the logical port, is Enabled if any of state (Normal, Aggressive) is <b>Enabled</b> . |
| Device ID (local)   | The ID of Device.                                                                                               |
| Device Name (local) | Name of the Device.                                                                                             |
| Bidirectional State | The current state of the port.                                                                                  |
| Neighbor Status     |                                                                                                                 |
| Port                | The current port of neighbor device.                                                                            |
| Device ID (local)   | The ID of neighbor device.                                                                                      |
| Link Status         | The current link status of neighbor port.                                                                       |
| Device Name (local) | Name of the neighbor device.                                                                                    |

# 5 Management

## 5.1 General Introduction

The R Class series can be remotely or locally managed via a variety of mechanisms/platforms with virtually no integration effort:

1. IP Based (in-band): SNMP (v1/v2/v3), Telnet (CLI), SSH, Web – HTTP/HTTPS.
2. Console (RJ-45): RS-232 (115200Bd) CLI (Cisco like).

### 5.1.1 System Information

This section provides general information about the system.

**Web GUI: Monitor > System > Information**

#### System Information

| System           |                                                           |

**Table 5-2: System Status Parameters**

| System Status                 |                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Time                          | The current (GMT) system time and date. The system time is obtained through the Timing server running on the switch, if any. |
| Uptime                        | The period the device has been operational.                                                                                  |
| Device Temperature            | The device actual temperature.                                                                                               |
| Estimated Ambient Temperature | The estimated ambient temperature.                                                                                           |
| Memory utilization            | Derived from the percent of available memory in use at a given moment.                                                       |

#### Power Supply Status

| Source         | Power                                                                                        | Fan 1                                                                               |       | Fan 2                                                                                 |       |
|----------------|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------|---------------------------------------------------------------------------------------|-------|
|                |                                                                                              | Status                                                                              | Speed | Status                                                                                | Speed |
| PSU 1 - Feed 1 |  Ok       |  | 7980  |  | 7680  |
| PSU 2 - Feed 1 |  Disabled |  | 0     |  | 0     |

**Figure 5-3: Power Supply Status**

**Table 5-3: Power Supply Status Parameters**

| Power Supply Status |                                                         |
|---------------------|---------------------------------------------------------|
| Source              | Indicate which power supply is installed/not installed. |
| Power               | Indicate if PS is up or disable.                        |
| Fan                 | Indicate the status of the Fan (if any).                |

### 5.1.3 CPU Load

This page displays the CPU load, using an SVG graph.

The load is measured as averaged over the last 100ms, 1sec and 10 seconds intervals. The last 120 samples are graphed, and the last numbers are displayed as text as well.

To display the SVG graph, your browser must support the SVG format. Consult the SVG Wiki for more information on browser support. Specifically, at the time of writing, Microsoft Internet Explorer will need to have a plug-in installed to support SVG.

**Web GUI: Monitor > System > CPU Load**

**Figure 5-4: CPU Load**

### 5.1.4 IP Status

This section displays the status of the IP protocol layer. The status is defined by the IP interfaces, the IP routes and the neighbor cache (ARP cache) status.

**Web GUI: Monitor > System > IP Status**

**IP Interfaces**

Auto-refresh  Refresh

| Interface | Type | Address                     | Status                           |
|-----------|------|-----------------------------|----------------------------------|
| OS:lo     | LINK | 00-00-00-00-00-00           | <UP LOOPBACK RUNNING MULTICAST>  |
| OS:lo     | IPv4 | 127.0.0.1/8                 |                                  |
| OS:lo     | IPv6 | fe80::1/64                  |                                  |
| OS:lo     | IPv6 | ::1/128                     |                                  |
| VLAN1     | LINK | 00-05-80-00-83-dd           | <UP BROADCAST RUNNING MULTICAST> |
| VLAN1     | IPv4 | 192.168.3.87/24             |                                  |
| VLAN1     | IPv6 | fe80::205:80ff:fe00:83dd/64 |                                  |

**IP Routes**

| Network      | Gateway     | Status             |
|--------------|-------------|--------------------|
| 0.0.0.0/0    | 192.168.3.1 | <UP GATEWAY HW_RT> |
| 127.0.0.1/32 | 127.0.0.1   | <UP HOST>          |
| 224.0.0.0/4  | 127.0.0.1   | <UP>               |
| ::1/128      | ::1         | <UP HOST>          |

**Neighbour cache**

| IP Address               | Link Address            |
|--------------------------|-------------------------|
| 192.168.3.1              | VLAN1:40-f4-ec-e0-86-45 |
| fe80::205:80ff:fe00:83dd | VLAN1:00-05-80-00-83-dd |

**Figure 5-5: IP Status displays**

**Table 5-4: IP Status displays Parameters**

| IP Interfaces  |                                                                                       |
|----------------|---------------------------------------------------------------------------------------|
| Interface      | The name of the interface.                                                            |
| Type           | The address type of the entry. This may be <b>LINK</b> , <b>IPv4</b> or <b>IPv6</b> . |
| Address        | The current address of the interface (of the given type).                             |
| Status         | The status flags of the interface (and/or address).                                   |
| IP Routes      |                                                                                       |
| Network        | The destination IP network or host address of this route.                             |
| Gateway        | The gateway address of this route.                                                    |
| Status         | The status flags of the route.                                                        |
| Neighbor cache |                                                                                       |
| IP Address     | The IPv4/IPv6 address of the entry.                                                   |
| Link Address   | Link (MAC) address for which a binding to the IP address given exist.                 |

**5.1.5 System Log Information**

The switch system log information is provided here.

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table. The **Level** input field is used to filter the display system log entries. The **Clear Level** input field is used to specify which system log entries will be cleared. To clear specific system log entries, select the clear level first then click the **Clear** button. The **Start from ID** input field allow the user to change the starting point in this table.

Clicking the **Refresh** button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a **Refresh** button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

The >> will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the << to start over.

| Message                         | The detailed message of the system log entry. |

## 5.2 DHCP (Dynamic Host Configuration Protocol)

DHCP is an acronym for **D**ynamic **H**ost **C**onfiguration **P**rotocol. It provides a complete description of a mathematical algorithm for encrypting (enciphering) and decrypting (deciphering) binary coded information.

DHCP used by networked computers (clients) to obtain IP addresses and other parameters such as the default gateway, subnet mask, and IP addresses of DNS servers from a DHCP server.

The DHCP server ensures that all IP addresses are unique, for example, no IP address is assigned to a second client while the first client's assignment is valid (its lease has not expired). Therefore, IP address pool management is done by the server and not by a human network administrator.

Dynamic addressing simplifies network administration because the software keeps track of IP addresses rather than requiring an administrator to manage the task. This means that a new computer can be added to a network without the hassle of manually assigning it a unique IP address.

### 5.2.1 DHCP Server Mode Configuration

DHCP Server is used to allocate network addresses and deliver configuration parameters to dynamically configured hosts called DHCP client.

This section configures global mode and VLAN mode to enable/disable DHCP server per system and per VLAN.

DHCP Server is used to allocate network addresses and deliver configuration parameters to dynamically configured hosts called DHCP client.

**Web GUI: Configuration > DHCP > Server > Mode**

#### DHCP Server Mode Configuration

##### Global Mode

|      |            |

| Indicate the VLAN range in which DHCP server is enabled or disabled. The first VLAN ID must be smaller than or equal to the second VLAN ID. BUT, if the VLAN range contains only 1 VLAN ID, then you can just input it into either one of the first and second VLAN ID or both. On the other hand, if you want to disable existed VLAN range, then you can follow the steps:<br>1. Press <b>Add VLAN Range</b> to add a new VLAN range<br>2. Input the VLAN range that you want to disable<br>3. Choose Mode to be <b>Disabled</b> .<br>4. Press <b>Save</b> to apply the change<br>Then, you will see the disabled VLAN range is removed from the DHCP Server mode configuration page. |                                                       |

| Indicate the operation mode per VLAN. Possible modes are:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                       |
| Enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Enable DHCP server per VLAN.                          |
| Disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Disable DHCP server pre VLAN.                         |
| Buttons                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Add VLAN Range:</b> Click to add a new VLAN range. |

### 5.2.2 DHCP Server Excluded IP Configuration

This section configures excluded IP addresses. DHCP server will not allocate these excluded IP addresses to DHCP client.

**Web GUI: Configuration > DHCP > Server > Excluded IP**

#### DHCP Server Excluded IP Configuration

Excluded IP Address

**Delete** **IP Range**

Add IP Range

Apply Reset

**Figure 5-9: DHCP Server Excluded IP Configuration**

**Table 5-8: DHCP Server Excluded IP Configuration Parameters**

|                                  |                                                                                                                                                                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Excluded IP Address              |                                                                                                                                                                                                                                                           |
| Configure excluded IP addresses. |                                                                                                                                                                                                                                                           |
| Delete                           | Delete Excluded Ip Address operation                                                                                                                                                                                                                      |
| IP Range                         | Define the IP Range to be excluded. The first excluded IP must be smaller than or equal to the second excluded IP. BUT, if the IP range contains only 1 excluded IP, then you can just input it to either one of the first and second excluded IP or both |
| Buttons                          | <b>Add IP Range:</b> Click to add anew exclude IP range.                                                                                                                                                                                                  |

### 5.2.3 DHCP Server Pool Configuration

This page manages DHCP pools. According to the DHCP pool, DHCP server will allocate IP address and deliver configuration parameters to DHCP client.

**Web GUI: Configuration > DHCP > Server > Pool**

DHCP Server Pool Configuration

Pool Setting

| Delete | Name | Type | IP | Subnet Mask | Reserved only | Lease Time               |
|--------|------|------|----|-------------|---------------|--------------------------|
| Delete |      | -    | -  | -           | -             | 1 days 0 hours 0 minutes |

Add New Pool

Apply Reset

**Figure 5-10: DHCP Server Pool Configuration**

**Table 5-9: DHCP Server Pool Configuration Parameters**

| Pool Setting |                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>Add or delete pools.</p> <p>Adding a pool and giving a name is to create a new pool with "default" configuration.</p> <p>If you want to configure all settings including type, IP subnet mask and lease time, you can click the pool name to go into the configuration page.</p>                                                                       |
| Name         | Configure the pool name that accepts all printable characters, except white space. If you want to configure the detail settings, you can click the pool name to go into the configuration page.                                                                                                                                                           |
| Type         | <p>Display which types of pool is:</p> <ul style="list-style-type: none"> <li><b>Network:</b> the pool defines a pool of IP addresses to service more than one DHCP client.</li> <li><b>Host:</b> the pool services for a specific DHCP client identified by client identifier or hardware address. If "-" is displayed, it means not defined.</li> </ul> |
| IP           | Display network number of the DHCP address pool. If "-" is displayed, it means not defined.                                                                                                                                                                                                                                                               |

|               |                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------|
| Subnet Mask   | Display subnet mask of the DHCP address pool. If "-" is displayed, it means not defined.                   |
| Reserved Only | If on, Ip addresses obtainable from the pool are limited to those entered into the reserved entries table. |
| Lease Time    | Display lease time of the pool.                                                                            |

**Table 5-10: Snooping Configuration Parameters**

| DHCP Snooping Configuration |                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Snooping mode               | Indicates the DHCP Snooping mode of operation. Possible modes are:<br><br><b>Enabled:</b> Enable DHCP snooping mode operation. When DHCP snooping mode operation is enabled, the DHCP request messages will be forwarded to trusted ports and only allow reply packets from trusted ports.<br><br><b>Disabled:</b> Disable DHCP snooping mode operation. |
| Port Mode Configuration     | Indicates the DHCP snooping mode. Possible modes are:<br><br><b>Trusted:</b> Configures the port as trusted source of the DHCP messages.<br><br><b>Untrusted:</b> Configures the port as untrusted source of the DHCP messages.                                                                                                                          |

### 5.2.5 Dynamic DHCP Snooping

This page display the dynamic IP assigned information after DHCP Snooping mode is disabled.

All DHCP clients obtained the dynamic IP address from the DHCP server will be listed in this table except for local VLAN interface IP addresses. Entries in the Dynamic DHCP snooping Table are shown on this section

**Web GUI: Monitor > DHCP > Snooping Table**

**Dynamic DHCP Snooping Table** Auto-refresh  Refresh << >>

Start from MAC address  , VLAN  with  entries per page.

| MAC Address     | VLAN ID | Source Port | IP Address | IP Subnet Mask | DHCP Server |
|-----------------|---------|-------------|------------|----------------|-------------|
| No more entries |         |             |            |                |             |

**Figure 5-12: Dynamic DHCP Snooping Table**

**Table 5-11: Dynamic DHCP Snooping Table Parameters**

| Dynamic DHCP snoopingTable                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| MAC Address                                                                                                                                                                                                                                                                                                                                                                                                                                       | User MAC address of the entry                          |
| VLAN ID                                                                                                                                                                                                                                                                                                                                                                                                                                           | VLAN-ID in which the DHCP traffic is permitted         |
| Source Port                                                                                                                                                                                                                                                                                                                                                                                                                                       | Switch Port Number for which the entries are displayed |
| IP Address                                                                                                                                                                                                                                                                                                                                                                                                                                        | User IP address of the entry                           |
| IP Subnet Mask                                                                                                                                                                                                                                                                                                                                                                                                                                    | User IP subnet mask of the entry                       |
| DHCP Server Address                                                                                                                                                                                                                                                                                                                                                                                                                               | DHCP Server address of the entry                       |
| <p>Navigating the DHCP snooping Table</p> <p>Each page shows up to 99 entries from the, Dynamic DHCP snooping table, default being 20, selected through the “entries per page” input field. When first visited, the web page will show the first 20 entries from the beginning of the Dynamic DHCP snooping Table. The “MAC address” and “VLAN” input fields allows the user to select the starting point in the Dynamic DHCP snooping Table.</p> |                                                        |

Clicking the **Refresh** button will update the displayed table starting from that or the closest next MVR Channels (Groups) Information Table match.

In addition, the two input fields will – upon a **Refresh** button click – assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The >> will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text “No more entries” is shown in the displayed table. Use the << button to start over.

### 5.2.6 DHCP Relay Configuration

A DHCP relay agent is used to forward and to transfer DHCP messages between the clients and the server when they are not in the same subnet domain.

It stores the incoming interface IP address in the GIADDR field of the DHCP packet. The DHCP server can use the value of GIADDR field to determine the assigned subnet. For such condition, please make sure the switch configuration of VLAN interface IP address and PVID (Port VLAN ID) correctly.

**Web GUI: Configuration > DHCP > Relay**

#### DHCP Relay Configuration

|                          |          |
|--------------------------|----------|
| Relay Mode               | Disabled |
| Relay Server             | 0.0.0.0  |
| Relay Information Mode   | Disabled |
| Relay Information Policy | Keep     |

**Figure 5-13: DHCP Relay Configuration**

**Table 5-12: DHCP Relay Configuration Parameters**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Relay Mode             | <p>Indicates the DHCP relay mode operation. Possible modes are:</p> <ul style="list-style-type: none"> <li><b>Enabled:</b> Enable DHCP relay mode operation. When DHCP relay mode operation is enabled, the agent forwards and transfers DHCP messages between the clients and the server when they are not in the same subnet domain. And the DHCP broadcast message won't be flooded for security considerations.</li> <li><b>Disabled:</b> Disable DHCP relay mode operation.</li> </ul>                                                                            |
| Relay Server           | Indicates the DHCP relay server IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Relay Information Mode | <p>Indicates the DHCP relay information mode option operation. The option 82 circuit ID format as "[vlan_id][module_id][port_no]". The first four characters represent the VLAN ID, the fifth and sixth characters are the module ID (in standalone device it is always equal 0, in stackable device it means switch ID) and the last two characters are the port number. For example, "00030108" means the message receives form VLAN ID 3, switch ID 1, port No 8. And the option 82 remote ID value is equal the switch MAC address.</p> <p>Possible modes are:</p> |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Enable DHCP relay information mode operation. When DHCP relay information mode operation is enabled, the agent inserts specific information (option 82) into a DHCP message when forwarding to DHCP server and removes it from a DHCP message when transferring to DHCP client. It only works when DHCP relay operation mode is enabled.</li> <li>• <b>Disabled:</b> Disable DHCP relay information mode operation.</li> </ul>                                                                                                                                                                             |
| Relay Information Policy | <p>Indicates the DHCP relay information option policy. When DHCP relay information mode operation is enabled, if agent receives a DHCP message that already contains relay agent information it will enforce the policy. And it only works under DHCP if relay information operation mode is enabled. Possible policies are:</p> <p>Replace: Replace the original relay information when a DHCP message that already contains it is received.</p> <p>Keep: Keep the original relay information when a DHCP message that already contains it is received.</p> <p>Drop: Drop the package when a DHCP message that already contains relay information is received.</p> |
|                          | Drop: Drop the package when a DHCP message that already contains relay information is received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### 5.2.7 DHCP Relay Statistics

R Class series provide statistics for DHCP relay, which is used to forward and to transfer DHCP messages between the clients and the server when they are not on the same subnet domain. Note: for a detailed description of the DHCP Relay feature, go to [DHCP Relay Configuration](#).

#### Web GUI: Monitor > DHCP > Relay Statistics

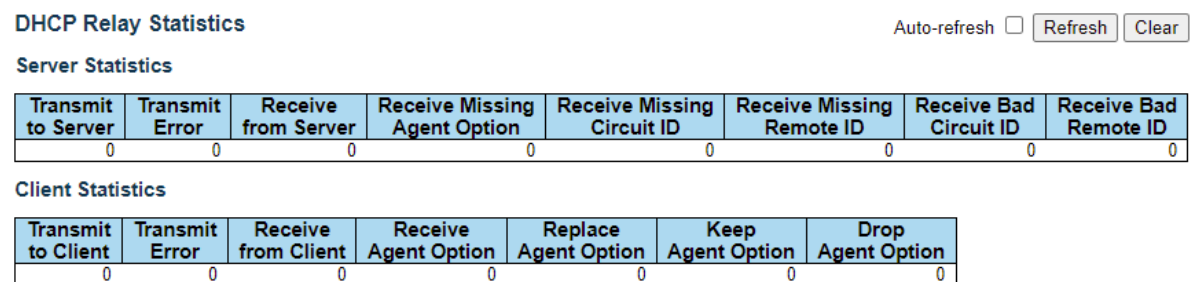

Figure 5-14: DHCP Relay Statistics

Table 5-13: DHCP Relay Statistics Parameters

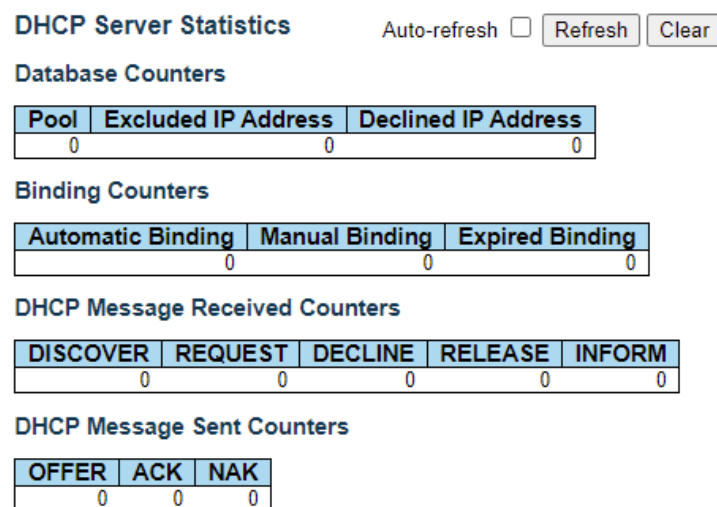

| Server Statistics            |                                                                          |
|------------------------------|--------------------------------------------------------------------------|
| Transmit to Server           | The number of packets that are relayed from client to server.            |
| Transmit Error               | The number of packets that resulted in errors while being sent to client |
| Receive from Server          | The packets number received from server.                                 |
| Receive Missing Agent Option | The number of packets received without agent information options.        |

|                            |                                                                                           |
|----------------------------|-------------------------------------------------------------------------------------------|
| Receive Missing Circuit ID | The number of packets received with the Circuit ID option missing.                        |
| Receive Missing Remote ID  | The number of packets received with the remote ID option missing.                         |
| Receive Bad Circuit ID     | The number of packets received with the Circuit ID option did not match known circuit ID. |
| Receive Bad Remote ID      | The packets number of which the Remote ID option did not match known Remote ID.           |
| <b>Client Statistics</b>   |                                                                                           |
| Transmit to Client         | The number of relayed packets from server to client.                                      |
| Transmit Error             | The number of packets that resulted in error while being sent to servers.                 |
| Receive from Client        | The number of received packets from server.                                               |
| Receive Agent Option       | The number of received packets with relay agent information option.                       |
| Replace Agent Option       | The number of received packets with relay agent information option.                       |
| Keep Agent option          | The number of packets whose relay agent information was retained.                         |
| Drop Agent option          | The number of packets that were dropped which were received with relay agent information. |

### 5.2.8 DHCP Server Statistics

This section displays the database counters and the number of DHCP messages sent and received by DHCP server.

**Web GUI: Monitor > DHCP > Server > Statistics**

**Figure 5-15: DHCP Server Statistics**

**Table 5-14: DHCP Server Statistics Parameters**

| Database Counters                      |                                                                                                             |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------|
| Display counters of various databases. |                                                                                                             |
| Pool                                   | Number of pools                                                                                             |
| Excluded IP Address                    | Number of excluded IP address ranges                                                                        |
| Declined IP Address                    | Number of declined IP addresses.                                                                            |
| Binding Counters                       |                                                                                                             |
| Display counters of various databases. |                                                                                                             |
| Automatic Number Binding               | Number of bindings with network-type pools.                                                                 |
| Manual Binding                         | Number of bindings that administrator assigns an IP address to a client. That is, the pool is of host type. |
| Expired Binding                        | Number of bindings that their lease time expired, or they are cleared from Automatic/Manual type bindings.  |
| DHCP Message Received Counters         |                                                                                                             |
| DISCOVER                               | Number of DHCP DISCOVER messages received.                                                                  |
| REQUEST                                | Number of DHCP REQUEST messages received.                                                                   |
| DECLINE                                | Number of DHCP DECLINE messages received.                                                                   |
| RELEASE                                | Number of DHCP RELEASE messages received.                                                                   |
| INFORM                                 | Number of DHCP INFORM messages received.                                                                    |
| DHCP Message Sent Counters             |                                                                                                             |
| OFFER                                  | Number of DHCP OFFER messages sent.                                                                         |
| ACK                                    | Number of DHCP ACK messages sent.                                                                           |
| NAK                                    | Number of DHCP NAK messages sent.                                                                           |

### 5.2.9 DHCP Server Binding IP

This section displays bindings generated for DHCP clients.

**Web GUI: Monitor > DHCP > Server > Binding**

**DHCP Server Binding IP**    Auto-refresh     Refresh    Clear Selected    Clear Automatic    Clear Manual    Clear Expired

**Binding IP Address**

| Delete | IP | Type | State | Pool Name | Server/Relay IP |
|--------|----|------|-------|-----------|-----------------|
|--------|----|------|-------|-----------|-----------------|

**Figure 5-16: DHCP Server Binding IP**

**Table 5-15: DHCP Server Binding IP Parameters**

| Binding IP Address |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP                 | IP address allocated to DHCP client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Type               | Type of binding. Possible types are Automatic, Manual, Expired.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| State              | State of binding. Possible states are Committed, Allocated, Expired.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Pool Name          | The pool that generates the binding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Server/Relay IP    | Either IP address of dhcp server or, in case of relayed binding, IP address of relay agent through which binding was negotiated.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Buttons            | <ul style="list-style-type: none"> <li>• <b>Clear Selected:</b> Click to clear selected bindings. If the selected binding is Automatic or Manual, then it is changed to be Expired. If the selected binding is Expired, then it is freed.</li> <li>• <b>Clear Automatic:</b> Click to clear all Automatic bindings and change them to Expired bindings.</li> <li>• <b>Clear Manual:</b> Click to clear all Manual bindings and change them to Expired bindings.</li> <li>• <b>Clear Expired:</b> Click to clear all Expired bindings and free them.</li> </ul> |

### 5.2.10 DHCP Server Declined IP

This section displays declined IP addresses.

**Web GUI: Monitor > DHCP > Server > Declined IP**

**Figure 5-17: DHCP Server Declined IP**

**Table 5-16: DHCP Server Declined IP Parameters**

| Declined IP Address                            |                                |
|------------------------------------------------|--------------------------------|
| Display IP addresses declined by DHCP clients. |                                |
| Declined IP                                    | List of IP addresses declined. |

### 5.2.11 DHCP Detailed Statistics Port 1

This page provides statistics for DHCP snooping.

Notice that the normal forward per-port TX statistics is not increased if the incoming DHCP packet is done by L3 forwarding mechanism. And clear the statistics on specific port may not take effect on global statistics since it gathers the different layer overview.

Web GUI: Monitor > DHCP > Detailed Statistics

**DHCP Detailed Statistics Port 1** Combined Port 1  Auto-refresh Refresh Clear

| Receive Packets             |   | Transmit Packets    |   |
|-----------------------------|---|---------------------|---|
| Rx Discover                 | 0 | Tx Discover         | 0 |
| Rx Offer                    | 0 | Tx Offer            | 0 |
| Rx Request                  | 0 | Tx Request          | 0 |
| Rx Decline                  | 0 | Tx Decline          | 0 |
| Rx ACK                      | 0 | Tx ACK              | 0 |
| Rx NAK                      | 0 | Tx NAK              | 0 |
| Rx Release                  | 0 | Tx Release          | 0 |
| Rx Inform                   | 0 | Tx Inform           | 0 |
| Rx Lease Query              | 0 | Tx Lease Query      | 0 |

| DHCP Detailed Statistics Port 1 |                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------|
| Rx and Tx Discover              | The number of of discover (option 53 with value 1) packets received and transmitted.       |
| Rx and Tx Offer                 | The number of offer (option 53 with value 2) packets received and transmitted.             |
| Rx and Tx Request               | The number of request (option 53 with value 3) packets received and transmitted.           |
| Rx and Tx Decline               | The number of of decline (option 53 with value 4) packets received and transmitted.        |
| Rx and Tx ACK                   | The number of ACK (option 53 with value 5) packets received and transmitted.               |
| Rx and Tx NAK                   | The number of NAK (option 53 with value 6) packets received and transmitted.               |
| Rx and Tx Release               | The number of release (option 53 with value 7) packets received and transmitted.           |
| Rx and Tx Inform                | The number of inform (option 53 with value 8) packets received and transmitted.            |
| Rx and Tx Lease Query           | The number of lease query (option 53 with value 10) packets received and transmitted.      |
| Rx and Tx Lease Unassigned      | The number of lease unassigned (option 53 with value 11) packets received and transmitted. |
| Rx and Tx Lease Unknown         | The number of lease unknown (option 53 with value 12) packets received and transmitted.    |
| Rx and Tx Lease Active          | The number of lease active (option 53 with value 13) packets received and transmitted.     |

| <b>DHCP Detailed Statistics Port 1</b> |                                                                     |
|----------------------------------------|---------------------------------------------------------------------|
| Rx Discarded checksum error            | The number of discard packet that IP/UDP checksum is error.         |
| Rx Discarded from Untrusted            | The number of discarded packet that are coming from untrusted port. |

## 5.3 Simple Network Management Protocol (SNMP)

R Class series supports **SNMP** management, inspection and configuration.

The following screens are used to set SNMP System Configuration and SNMP Trap settings.

- SNMP System Configuration
- SNMPv3 Trap Configuration
- SNMPv3 Community Configuration
- SNMPv3 Users Configuration
- SNMPv3 Group Configuration
- SNMPv3 View Configuration
- SNMPv3 Access Configuration

### 5.3.1 SNMP System Configuration

**Web GUI: Configuration > SNMP > System**

#### SNMP System Configuration

| SNMP System Configuration |                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode                      | Indicate the SNMP mode operation. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Enable SNMP mode operation.</li> <li>• <b>Disabled:</b> Disable SNMP mode operation.</li> </ul>                                   |
| Engine ID                 | Indicates the SNMPv3 engine ID. The string must contain an even number (in hexadecimal format) with number of digits between 10 and 64, but all-zeros and all-'F's are not allowed. Change of the Engine ID will clear all original local users. |

### 5.3.2 Trap Configuration

Configure the SNMP trap on this section.

**Web GUI: Configuration > SNMP > System**

#### SNMP Trap Configuration

|                               |                                           |
|-------------------------------|-------------------------------------------|
| Trap Config Name              | <input type="text"/>                      |
| Trap Mode                     | Disabled <input type="button" value="v"/> |
| Trap Version                  | SNMP v2c <input type="button" value="v"/> |
| Trap Community                | public                                    |
| Trap Destination Address      | <input type="text"/>                      |
| Trap Destination Port         | 162                                       |
| Trap Inform Mode              | Disabled <input type="button" value="v"/> |
| Trap Inform Timeout (seconds) | 3                                         |
| Trap Inform Retry Times       | 5                                         |
| Trap Security Engine ID       | 800019cb0300058011ccff                    |
| Trap Security Name            | None <input type="button" value="v"/>     |

**Figure 5-20: SNMP Trap Configuration display**

**Table 5-19: SNMP Trap Configuration Parameters**

| SNMP Trap Detailed Configuration |                                                                                                                                                                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Config Name                      | Indicates which trap Configuration's name for configuring. The allowed string length is 1 to 32, and the allowed content is ASCII characters from 33 to 126.                                                                                                                           |
| Mode                             | Indicate the SNMP trap mode operation. Possible modes are: <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Enable SNMP trap mode operation.</li> <li>• <b>Disabled:</b> Disable SNMP trap mode operation.</li> </ul>                                                          |
| Version                          | Indicate the SNMP trap version. Possible versions are: <ul style="list-style-type: none"> <li>• <b>SNMP v1:</b> Set SNMP trap supported version 1.</li> <li>• <b>SNMP v2c:</b> Set SNMP supported version 2c.</li> <li>• <b>SNMP v3:</b> Set SNMP trap supported version 3.</li> </ul> |
| Community                        | Indicates the community access string when sending SNMP trap packet. The allowed string length is 0 to 63, and the allowed content is ASCII characters from 33 to 126.                                                                                                                 |

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination Address               | <p>Indicates the SNMP trap destination address. It allows a valid IP address in dotted decimal notation ('x.y.z.w').</p> <p>And it also allows a valid hostname. A valid hostname is a string drawn from the alphabet (A-Za-z), digits (0-9), dot (.), dash (-). Spaces are not allowed, the first character must be an alpha character, and the first and last characters must not be a dot or a dash.</p> <p>Indicates the SNMP trap destination IPv6 address. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:). For example, 'fe80:: 215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of contiguous zeros; but it can appear only once. It can also represent a legally valid IPv4 address. For example, ':: 192.1.2.34'.</p> |
| Destination port                  | Indicates the SNMP trap destination port SNMP Agent will send SNMP message via this port; the port range is 1~65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Inform Mode                       | <p>Indicates the SNMP trap inform mode operation. Possible modes are:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Enable SNMP trap inform mode operation.</li> <li>• <b>Disabled:</b> Disable SNMP trap inform mode operation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Inform Timeout (seconds)          | Indicates the SNMP trap inform timeout. The allowed range is 0 to 2147.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Inform Retry Times                | Indicates the SNMP trap inform retry times. The allowed range is 0 to 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Security Engine ID                | Indicates the SNMP trap security engine ID. SNMPv3 sends traps and informs using USM for authentication and privacy. A unique engine ID for these traps and informs is needed. The string must contain an even number (in hexadecimal format) with number of digits between 10 and 64, but all-zeros and all-'F's are not allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Security Name                     | Indicates the SNMP trap security name. SNMPv3 traps and informs using USM for authentication and privacy. A unique security name is needed when traps and informs are enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Trap Event</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Configure SNMP trap on this page. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### 5.3.3 Trap Source Configurations

This page provides SNMP trap source configurations. A trap is sent for the given trap source if at least one filter with filter type included matches the filter, and no filters with filter type excluded matches.

**Web GUI: Configuration > SNMP > Trap > Source**

#### Trap Configuration

##### Trap Source Configurations

| Delete          | Name | Type | Subset OID |
|-----------------|------|------|------------|
| No entry exists |      |      |            |

**Figure 5-21: SNMP Trap Source Configuration display**

**Table 5-20: SNMP Trap Source Configuration Parameters**

|            |                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete     | Check to delete the entry. It will be deleted during the next save.                                                                                                                                                                                                                                                                                                              |
| Name       | Indicates the name for the entry.                                                                                                                                                                                                                                                                                                                                                |
| Type       | <p>The filter type for the entry. Possible types are:</p> <ul style="list-style-type: none"> <li>• <b>Included</b>: An optional flag to indicate a trap is sent for the given trap source is matched.</li> <li>• <b>Excluded</b>: An optional flag to indicate a trap is not sent for the given trap source is matched.</li> </ul>                                               |
| Subset OID | <p>The subset OID for the entry. The value should depend on what kind of trap name. For example, the ifIndex is the subset OID of linkUp and linkDown. A valid subset OID is one or more digital number (0-4294967295) or asterisk (*) which are separated by dots(.). The first character must not begin with asterisk (*) and the maximum of OID count must not exceed 128</p> |

### 5.3.4 SNMPv3 Community Configuration

Configure SNMPv3 community table. The entry index key is “Community”.

**Web GUI: Configuration > SNMP > Communities**

#### SNMPv3 Community Configuration

| Delete                   | Community name | Community secret | Source IP | Source Prefix |
|--------------------------|----------------|------------------|-----------|---------------|
| <input type="checkbox"/> | public         | public           | 0.0.0.0   | 0             |
| <input type="checkbox"/> | private        | private          | 0.0.0.0   | 0             |

**Figure 5-22: SNMPv3 Community Configuration**

**Table 5-21: SNMPv3 Community Configuration Parameters**

|                  |                                                                                                                                                                                                               |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete           | Check to delete the entry. It will be deleted during the next save.                                                                                                                                           |
| Community Name   | Indicates the security name to map the community to the SNMP Groups configuration. The allowed string length is 1 to 32, and the allowed content is ASCII characters from 33 to 126.                          |
| Community Secret | Indicates the community secret (access string) to permit access using SNMPv1 and SNMPv2c to the SNMP agent. The allowed string length is 1 to 32, and the allowed content is ASCII characters from 33 to 126. |
| Source IP        | Indicates the SNMP access source address. A particular range of source addresses can be used to restrict source subnet when combined with source prefix.                                                      |
| Source Prefix    | Indicates the SNMP access source address prefix.                                                                                                                                                              |

### 5.3.5 SNMPv3 User Configuration

Configure **SNMPv3** user table. The entry index keys are **Engine ID** and **Username**.

**Web GUI: Configuration > SNMP > Users**

**SNMPv3 User Configuration**

| Delete                   | Engine ID              | User Name | Security Level | Authentication Protocol | Authentication Password | Privacy Protocol | Privacy Password |
|--------------------------|------------------------|-----------|----------------|-------------------------|-------------------------|------------------|------------------|
| <input type="checkbox"/> | 800019cb0300058011ccff |           | Auth. Priv     | MD5                     |                         | DES              |                  |

**Figure 5-23: SNMPv3 User Configuration**

**Table 5-22: SNMPv3 User Configuration Parameters**

| SNMPv3 User Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                    | Check to delete the entry. It will be deleted during the next save.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Engine ID                 | <p>An octet string identifying the engine ID that this entry should belong to.</p> <p>The string must contain an even number between 10 and 64 hexadecimal digits, but all-zeros and all-'F's are not allowed. The SNMPv3 architecture uses the User-based Security Model (USM) for message security and the View-based Access Control Model (VACM) for access control.</p> <p>For the USM entry, the usmUserEngineID and usmUserName are the entry's keys. In a simple agent, usmUserEngineID is always that agent's own snmpEngineID value.</p> <p>The value can also take the value of the snmpEngineID of a remote SNMP engine with which this user can communicate. In other words, if user engine ID equal system engine ID then it is local user; otherwise it's remote user.</p> |
| Username                  | <p>A string identifying the username that this entry should belong to.</p> <p>The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| SNMPv3 User Configuration |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Level            | <p>Indicates the security model that this entry should belong to. Possible security models are:</p> <ul style="list-style-type: none"> <li>• <b>NoAuth, NoPriv</b>: No authentication and no privacy.</li> <li>• <b>Auth, NoPriv</b>: Authentication and no privacy.</li> <li>• <b>Auth, Priv</b>: Authentication and privacy.</li> </ul> <p>The value of security level cannot be modified if the entry already exists. This means that must first ensure that the value is set correctly.</p>                                                                                        |
| Authentication Protocol   | <p>Indicates the authentication protocol that this entry should belong to. Possible authentication protocol are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: None authentication protocol.</li> <li>• <b>MD5</b>: An optional flag to indicate that this user is using MD5 authentication protocol.</li> <li>• <b>SHA</b>: An optional flag to indicate that this user is using SHA authentication protocol.</li> </ul> <p>The value of security level cannot be modified if the entry already exists. That means must first ensure that the value is set correctly.</p> |
| Authentication Password   | <p>A string identifying the authentication password phrase. For MD5 authentication protocol, the allowed string length is 8 to 32. For SHA authentication protocol, the allowed string length is 8 to 40. The allowed content is ASCII characters from 33 to 126.</p>                                                                                                                                                                                                                                                                                                                  |
| Privacy Protocol          | <p>Indicates the privacy protocol that this entry should belong to. Possible privacy protocols are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: None privacy protocol.</li> <li>• <b>DES</b>: An optional flag to indicate that this user is using DES encryption standard</li> <li>• <b>AES</b>: An optional flag to indicate that this user uses AES authentication protocol.</li> </ul>                                                                                                                                                                               |
| Privacy Password          | <p>A string identifying the privacy password phrase.</p> <p>The allowed string length is 8 to 32, and the allowed content is the ASCII characters from 33 to 126.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Buttons                   | <p><b>Add New Entry</b>: Click to add a new user entry.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 5.3.6 SNMPv3 Group Configuration

Configure **SNMPv3** groups table. The entry index keys are **Security Model** and **Security Name**.

Web GUI: Configuration > SNMP > Groups

### SNMPv3 Group Configuration

| Delete                   | Security Model | Security Name | Group Name       |
|--------------------------|----------------|---------------|------------------|
| <input type="checkbox"/> | v1             | public        | default_ro_group |
| <input type="checkbox"/> | v1             | private       | default_rw_group |
| <input type="checkbox"/> | v2c            | public        | default_ro_group |
| <input type="checkbox"/> | v2c            | private       | default_rw_group |

Figure 5-24: SNMPv3 Group Configuration

Table 5-23: SNMPv3 Group Configuration Parameters

| SNMPv3 Group Configuration |                                                                                                                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                     | Check the box to delete the entry. It will be deleted during the next save.                                                                                                                                                                                                     |
| Security Model             | Indicates the security model that this entry should belong to. Possible security models are: <ul style="list-style-type: none"> <li><b>v1</b>: Reserved for SNMPv1.</li> <li><b>v2c</b>: Reserved for SNMPv2c.</li> <li><b>usm</b>: User-based Security Model (USM).</li> </ul> |
| Security Name              | A string identifying the security name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.                                                                                                  |
| Group Name                 | A string identifying the group name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.                                                                                                     |

### 5.3.7 SNMPv3 View Configuration

Configure **SNMPv3** views table. The entry index keys are **View Name** and **OID Subtree**.

Web GUI: Configuration > SNMP > Views

### SNMPv3 View Configuration

| Delete                                | View Name            | View Type  | OID Subtree          |
|---------------------------------------|----------------------|------------|----------------------|
| <input type="checkbox"/>              | default_view         | included ▼ | .1                   |
| <input type="button" value="Delete"/> | <input type="text"/> | included ▼ | <input type="text"/> |

Table 5-24: SNMPv3 View Configuration Parameters

| SNMPv3 View Configuration |                                                                     |
|---------------------------|---------------------------------------------------------------------|
| Delete                    | Check to delete the entry. It will be deleted during the next save. |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| View Name   | A string identifying the view name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.                                                                                                                                                                                                                                                                                                                                                                                              |
| View Type   | <p>Indicates the view type that this entry should belong to. Possible view type is:</p> <ul style="list-style-type: none"> <li>• <b>Included:</b> An optional flag to indicate that this subtree view should be included.</li> <li>• <b>Excluded:</b> An optional flag to indicate that this subtree view should be excluded.</li> </ul> <hr/> <p><i>Note: In general, if a view entry's view type is 'excluded', there should be another view entry existing with view type as 'included' and its OID subtree should overstep the 'excluded' view entry.</i></p> <hr/> |
| OID Subtree | The OID defining the root of the sub tree to be added to the named view. The allowed OID length is 1 to 128. The allowed string content is a digital number or an asterisk (*).                                                                                                                                                                                                                                                                                                                                                                                         |

### 5.3.8 SNMPv3 Access Configuration

Configure **SNMPv3** accesses table. The entry index keys are **Group Name**, **Security Model** and **Security Level**.

**Web GUI: Configuration > SNMP > Access**

#### SNMPv3 Access Configuration

| Delete                   | Group Name       | Security Model | Security Level | Read View Name | Write View Name |
|--------------------------|------------------|----------------|----------------|----------------|-----------------|
| <input type="checkbox"/> | default_ro_group | any            | NoAuth, NoPriv | default_view ▼ | None ▼          |
| <input type="checkbox"/> | default_rw_group | any            | NoAuth, NoPriv | default_view ▼ | default_view ▼  |

**Figure 5-26: SNMPv3 Access Configuration**

**Table 5-25: SNMPv3 Access Configuration Parameters**

| SNMPv3 Access Configuration |                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delete                      | Check to delete the entry. It will be deleted during the next save.                                                                                                                                                                                                                                                                                           |
| Group Name                  | A string identifying the group name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.                                                                                                                                                                                   |
| Security Model              | <p>Indicates the security model that this entry should belong to. Possible security models are:</p> <ul style="list-style-type: none"> <li>• <b>Any:</b> Any security model accepted (v1 v2c usm).</li> <li>• <b>v1:</b> Reserved for SNMPv1.</li> <li>• <b>V2c:</b> Reserved for SNMPv2c.</li> <li>• <b>Usm:</b> User-based Security Model (USM).</li> </ul> |

|                 |                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Level  | Indicates the security model that this entry should belong to. Possible security models are: <ul style="list-style-type: none"><li>• <b>NoAuth, NoPriv:</b> No authentication and no privacy.</li><li>• <b>Auth, NoPriv:</b> Authentication and no privacy.</li><li>• <b>Auth, Priv:</b> Authentication and privacy.</li></ul> |
| Read View Name  | The name of the MIB view, defining the MIB objects for which this request may request the current values. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.                                                                                                                |
| Write View Name | The name of the MIB view, defining the MIB objects for which this request may potentially SET new values. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.                                                                                                                |

## 5.4 Supported SNMP MIBs

The R Class series support a variety of MIBs. Future software versions will extend this list adding support for new features.

---

*Note: In order to retrieve the required MIB, you must access Fibrolan Web site/Support section.*

---

To download the complete Falcon RX MIB pack refer to the Resources section in the Fibrolan web site.

## 5.5 Command Line Interface (CLI)

CLI commands are used to manage the R Class series for displaying and modifying configuration of the various elements within the system.

Use one of the following methods to open a CLI session with the R Class series:

- Connect the switch console port to a management station. For information about connecting to the console port, refer to [Console Connection and Configuration](#).
- Open a Telnet session from a remote management station. The switch must have network IP connectivity with this remote management station.

Changes made by one Telnet user are reflected in all other Telnet sessions.

To Access R Class series via Telnet

Use any Telnet client application. The following example relates to Windows OS.

Start the “Run” option and in the command line enter:

```
“telnet XX.XX.XX.XX” (IP address of the R Class series)
```

The Telnet screen prompts for a username and password.

```
Username: moose
```

```
Password: 1234
```

### 5.5.1 SSH Configuration

Secure Shell or SSH is a network protocol that allows exchange of data between two networked devices using a secure channel. SSH has been designed to replace Telnet and other insecure remote applications. The encryption deployed by SSH provides integrity of data.

Configure SSH in this section. See [SSH Configuration](#).

### 5.5.2 HTTP Secure (HTTPS)

The R Class series supports secured web interface sessions using the HTTPS (HTTP over SSL) protocol.

HTTP is an acronym for **H**ypertext **T**ransfer **P**rotocol over **S**ecure Socket Layer. It is used to indicate a secure HTTP connection.

HTTPS provide authentication and encrypted communication and is widely used on the World Wide Web for security-sensitive communication such as payment transactions and corporate logons.

See [HTTPS Configuration](#).

## 5.6 Events Configuration

In this section, the user may change (enable/disable) the current events configuration.

### 5.6.1 Events Configuration table

Web GUI: Configuration > System > Events

Events Configuration

| #  | Event                                   | Severity | Enable                              | Interface                           |                                     |                                     |                                     |                                     | Status | Counter | Clear |
|----|-----------------------------------------|----------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|--------|---------|-------|
|    |                                         |          |                                     | SNMP                                | Syslog                              | CLI                                 | SMTP                                | Flash                               |        |         |       |
| *  |                                         |          | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |        |         |       |
| 1  | Cold start                              | Info     | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 2  | Warm start                              | Info     | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 3  | Link down                               | Warning  | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 4  | Link Up                                 | Info     | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | 1      | Clear   |       |
| 5  | SNMP Authentication failure             | Notice   | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 6  | PSU state change                        | Notice   | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 7  | Temperature state change                | Notice   | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 8  | CPU state change                        | Notice   | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 9  | SFP module plugged in                   | Info     | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 10 | SFP module unplugged                    | Info     | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | 0      | Clear   |       |
| 11 | SyncCenter state changed                | Notice   | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | 0      | Clear   |       |

| Event                | Unique Name of the Event.                                                                                                                                                                                                                                                                                                 |
| Severity             | The severity level of the listed events.<br><br>The following severity types are supported: <ul style="list-style-type: none"> <li>• <b>Informational:</b> Information level of the system log.</li> <li>• <b>Warning:</b> Warning level of the system log.</li> <li>• <b>Notice:</b> Made to help the memory.</li> </ul> |
| Enable               | Disable/Enable Event (Change will take effect on all checked interfaces: SNMP, syslog, cli).                                                                                                                                                                                                                              |
| Interface            | Distribute event on a given interface: SNMP, SYSLOG, CLI, FLASH.                                                                                                                                                                                                                                                          |
| Status               | Indication whether an event occurred or not.                                                                                                                                                                                                                                                                              |
| Counter              | The number of occurrences of the event since last Clear operation.                                                                                                                                                                                                                                                        |
| Clear                | Clear event occurred indication.                                                                                                                                                                                                                                                                                          |

## 5.7 Web Interface

To Access the R Class series through the Web Browse use the IP address of the device as described in the Getting Started chapter.

When accessing the R-Class series via the Web interface, the R-Class series Port State Overview window is displayed. Same event with the R-Class series.

### 5.7.1 Port Configuration

The various R Class devices ports can be configured using the procedure described in the [Port Configuration and Monitoring](#).

### 5.7.2 User Configuration & Edit User

This subsection provides an overview of the current users. Currently the only way to login as another user on the web server is to close and reopen the browser.

**Web GUI: Configuration > Security > Switch > Users**

#### Users Configuration

| User Name             | Privilege Level |
|-----------------------|-----------------|
| <a href="#">moose</a> | 15              |

**Figure 5-28: Users Configuration**

**Table 5-27: Users Configuration Parameters**

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username        | The name identifying the user. This is also a link to Add/Edit User display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Privilege level | The privilege level of the user. The allowed range is <b>1</b> to <b>15</b> . If the privilege level value is 15, it can access all groups, i.e., that is granted the fully control of the device. But others value must refer to each group privilege level. User's privilege should be same or greater than the group privilege level to have the access of that group. By default setting, most groups privilege level 5 has the read-only access and privilege level 10 has the read-write access. And the system maintenance (software upload, factory defaults etc.) need user privilege level 15. Generally, the privilege level 15 can be used for an administrator account, privilege level 10 for a standard user account and privilege level 5 for a guest account. |

By clicking on the “moose” word in the above Users Configuration display, you access the following display, which allows you to edit a user

**Web GUI: Configuration > Security > Switch > Users | Click one of the users under the User Name column**

**Edit User**

| User Settings   |       |
|-----------------|-------|
| User Name       | moose |
| Change Password | No    |
| Privilege Level | 15    |

**Figure 5-29: Edit User Configuration**

**Table 5-28: Edit Users Configuration Parameters**

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username        | A string identifying the username that this entry should belong to. The allowed string length is <b>1 to 31</b> . The valid username is a combination of letters, numbers and underscores.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Password        | The password of the user. The allowed string length is <b>0 to 31</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Privilege level | The privilege level of the user. The allowed range is <b>1 to 15</b> . If the privilege level value is 15, it can access all groups, i.e., that is granted the fully control of the device. But others value must refer to each group privilege level. User's privilege should be same or greater than the group privilege level to have the access of that group. By default setting, most groups privilege level 5 has the read-only access and privilege level 10 has the read-write access. And the system maintenance (software upload, factory defaults etc.) need user privilege level 15. Generally, the privilege level 15 can be used for an administrator account, privilege level 10 for a standard user account and privilege level 5 for a guest account. |

By clicking “Add New User” you get the: Add User” display to add a new user.

**Web GUI: Configuration > Security > Switch > Users | Add New User**

**Add User**

| User Settings    |   |
|------------------|---|
| User Name        |   |
| Password         |   |
| Password (again) |   |
| Privilege Level  | 0 |

**Figure 5-30: Add User Configuration**

The Parameters are the same as reported in the above table.

### 5.7.3 Authentication Method Configuration

The R Class series support multiple methods for user login authentication. The configured authentication method is applied to all user interfaces (console, Telnet/SSH and Web). The available methods in current version are shown in the following display:

**Web GUI: Configuration > Security > Switch > Auth Method**

#### Authentication Method Configuration

| Client  | Methods |      |      |
|---------|---------|------|------|
| console | local ▼ | no ▼ | no ▼ |
| telnet  | local ▼ | no ▼ | no ▼ |
| ssh     | local ▼ | no ▼ | no ▼ |
| http    | local ▼ | no ▼ | no ▼ |

#### Command Authorization Method Configuration

| Client  | Method | Cmd Lvl | Cfg Cmd                  |
|---------|--------|---------|--------------------------|
| console | no ▼   | 0       | <input type="checkbox"/> |
| telnet  | no ▼   | 0       | <input type="checkbox"/> |
| ssh     | no ▼   | 0       | <input type="checkbox"/> |

#### Accounting Method Configuration

| Client  | Method | Cmd Lvl | Exec                     |
|---------|--------|---------|--------------------------|
| console | no ▼   |         | <input type="checkbox"/> |
| telnet  | no ▼   |         | <input type="checkbox"/> |
| ssh     | no ▼   |         | <input type="checkbox"/> |

Apply Reset

**Figure 5-31: Authentication Method Configuration**

To access the related setup, go to: [Authentication Method Configuration](#).

### 5.7.4 Authentication Servers Configuration

This section allows the user to configure the different RADIUS Authentication Servers

To access this section, go to [Authentication Server Configuration \(AAA\)](#).

### 5.7.5 Access Management Configuration

In this section, you may configure the access management configuration

The maximum number of entries is **16**. If the application types match any one of the access management entries, it will allow access to the switch.

To configure the Access Management Configuration, go to: [Access Management Configuration](#).

## 5.8 RMON Overview

The RMON Overview includes the following displays:

- RMON Statistics Status Overview
- RMON History Overview
- RMON Alarm Overview
- RMON Event Overview

### 5.8.1 RMON Statistics Status Overview

This page provides an overview of RMON Statistics entries.

Each page shows up to 99 entries from the Event table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Event table. The first displayed will be the one with the lowest Event Index and Log Index found in the Event table. The "Start from Event Index and Log Index" allows the user to select the starting point in the Event table. Clicking the **Refresh** button will update the displayed table starting from that or the next closest Event table match.

The >> will use the last entry of the currently displayed entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table.

Use the <<: button to start over.

#### Web GUI: Monitor > RMON > Statistics

##### RMON Statistics Status Overview

Start from Control Index  with  entries per page.

| ID | Data Source (ifIndex) | Drop | Octets   | Pkts   | Broad-cast | Multi-cast | CRC Errors | Under-size | Over-size | Frag. | Jabb. | Coll. | 64 Bytes | 65 ~ 127 | 128 ~ 255 | 256 ~ 511 | 512 ~ 1023 | 1024 ~ 1588 |

Figure 4-5-32: Rmon Statistics Status Overview

Table 5-29: Rmon Statistics Status Overview Parameters

| RMON Statistics Status Overview |                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------|
| ID                              | Indicates the index of History control entry.                                                           |
| Data Source (ifIndex)           | The port ID which must be monitored.                                                                    |
| Drop                            | The value of sysUpTime at the start of the interval over which this sample was measured.                |
| Octets                          | The total number of events in which packets were dropped by the probe due to lack of resources.         |
| Pkts                            | The total number of packets (including bad packets, broadcast packets, and multicast packets) received. |

|            |                                                                                                                                                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Broadcast  | The total number of good packets received that were directed to the broadcast address.                                                                                                                                                                                                                                |
| Multicast  | The total number of good packets received that were directed to the multicast address.                                                                                                                                                                                                                                |
| CEC Errors | The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error) |
| Under size | The total number of packets received that were less than 64 octets.                                                                                                                                                                                                                                                   |
| Over size  | The total number of packets received that were longer than 1518 octets.                                                                                                                                                                                                                                               |
| Frag.      | The number of frames of a size lesser than 64 octets received with invalid CRC.                                                                                                                                                                                                                                       |
| Jabb.      | The number of frames which size is larger than 64 octets received with invalid CRC.                                                                                                                                                                                                                                   |
| Coll.      | The total number of octets of data (including those in bad packets) received on the network.                                                                                                                                                                                                                          |
| 64         | The total number of packets (including bad packets) received that were 64 octets in length.                                                                                                                                                                                                                           |
| 65~127     | The total number of packets (including bad packets) received that were between 65 to 127 octets in length.                                                                                                                                                                                                            |
| 128~255    | The total number of packets (including bad packets) received that were between 128 to 255 octets in length.                                                                                                                                                                                                           |
| 256~511    | The total number of packets (including bad packets) received that were between 256 to 511 octets in length.                                                                                                                                                                                                           |
| 512~1023   | The total number of packets (including bad packets) received that were between 512 to 1023 octets in length.                                                                                                                                                                                                          |
| 1024~1588  | The total number of packets (including bad packets) received that were between 1024 to 1588 octets in length                                                                                                                                                                                                          |

## 5.8.2 RMON History Overview

This section provides an overview of RMON History entries. Each page shows up to 99 entries from the Event table, default being 20, selected through the "entries per page" input field.

When first visited, the web page will show the first 20 entries from the beginning of the Event table. The first displayed will be the one with the lowest Event Index and Log Index found in the Event table.

The "Start from Event Index and Log Index" allows the user to select the starting point in the Event table. Clicking the **Refresh** button will update the displayed table starting from that or the next closest Event table match.

The >> will use the last entry of the currently displayed entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the <<: button to start over.

**Web GUI: Monitor > RMON > History**

**RMON History Overview**

Start from Control Index  and Sample Index  with  entries per page.

| History Index | Sample Index | Sample Start | Drop | Octets  | Pkts  | Broad-cast | Multi-cast | CRC Errors | Under-size | Over-size | Frag. | Jabb. | Coll. | Utilization |
|---------------|--------------|--------------|------|---------|-------|------------|------------|------------|------------|-----------|-------|-------|-------|-------------|
| 13            | 1            | 13440        | 0    | 7968301 | 96274 | 3717       | 87655      | 0          | 0          | 0         | 0     | 0     | 0     | 0           |

**Figure 5-33: Rmon History Overview**

**Table 5-30: Rmon History Overview Parameters**

| RMON History Overview |                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| History Index         | Indicates the index of History control entry.                                                                                                                                                                                                                                                                         |
| Sample Index          | Indicates the index of. the data entry associated with the control entry.                                                                                                                                                                                                                                             |
| Sample Start          | The value of sysUpTime at the start of the interval over which this sample was measured.                                                                                                                                                                                                                              |
| Drop                  | The total number of events in which packets were dropped by the probe due to lack of resources.                                                                                                                                                                                                                       |
| Octets                | The total number of octets of data (including those in bad packets) received on the network.                                                                                                                                                                                                                          |
| Pkts                  | The total number of packets (including bad packets, broadcast packets, and multicast packets) received.                                                                                                                                                                                                               |
| Broadcast             | The total number of good packets received that were directed to the broadcast address.                                                                                                                                                                                                                                |
| Multicast             | The total number of good packets received that were directed to a multicast address.                                                                                                                                                                                                                                  |
| CECErrors             | The total number of packets received that had a length (excluding framing bits but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). |
| Undersize             | The total number of packets received that were less than 64 octets.                                                                                                                                                                                                                                                   |
| Oversize              | The total number of packets received that were longer than 1518 octets.                                                                                                                                                                                                                                               |
| Frag.                 | The number of frames which size is less than 64 octets received with invalid CRC.                                                                                                                                                                                                                                     |
| Jabb.                 | The number of frames which size is larger than 64 octets received with invalid CRC.                                                                                                                                                                                                                                   |
| Coll.                 | The best estimate of the total number of collisions on this Ethernet segment.                                                                                                                                                                                                                                         |
| Utilization           | The best estimate of the mean physical layer network utilization on this interface during this sampling interval, in hundredths of a percent.                                                                                                                                                                         |

### 5.8.3 RMON Alarm Overview

This section provides an overview of RMON Alarm entries.

**Web GUI: Monitor > RMON > Alarm**

#### RMON Alarm Overview

Start from Control Index  with  entries per page.

| ID              | Interval | Variable | Sample Type | Value | Startup Alarm | Rising Threshold | Rising Index | Falling Threshold | Falling Index |
|-----------------|----------|----------|-------------|-------|---------------|------------------|--------------|-------------------|---------------|
| No more entries |          |          |             |       |               |                  |              |                   |               |

### 5.8.4 RMON Event Overview

This section provides an overview of RMON Event table entries. Each page shows up to 99 entries from the Event table, default being 20, selected through the "entries per page" input field.

When first visited, the web page will show the first 20 entries from the beginning of the Event table. The first displayed will be the one with the lowest Event Index and Log Index found in the Event table.

The "Start from Event Index and Log Index" allows the user to select the starting point in the Event table. Clicking the **Refresh** button will update the displayed table starting from that or the next closest Event table match.

The >> will use the last entry of the currently displayed entry as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the <<: button to start over.

**Web GUI: Monitor > RMON > Event**

#### RMON Event Overview

Start from Control Index  and Sample Index  with  entries per page.

| Event Index            | LogIndex | LogTime | LogDescription |
|------------------------|----------|---------|----------------|
| <i>No more entries</i> |          |         |                |

Auto-refresh

**Figure 5-35: Rmon Event Overview**

**Table 5-32: Rmon Alarm Overview Parameters**

| RMON Event Overview |                                         |
|---------------------|-----------------------------------------|
| Event Index         | Indicates the index of the event entry. |
| Log Index           | Indicates the index of the log entry.   |
| Log Time            | Indicates Event log time                |
| Log Description     | Indicates the Event description         |

# 6 Diagnostics

Diagnostics include the following procedures:

- Ping
- Ping6
- Link OAM MIB Retrieval
- Copper Link Test
- RFC2544
- Falcon Report Configuration

## 6.1.1 Ping IPv4

This section allows the user to issue ICMP PING packets to troubleshoot IP connectivity issues.

After you press, Start ICMP packets are transmitted, and the sequence number and round-trip time are displayed upon reception of a reply. The amount of data received inside of an IP packet of type ICMP ECHO\_REPLY will always be 8 bytes more than the requested data space (the ICMP header). The page refreshes automatically until responses to all packets are received, or until a timeout occurs.

PING server 10.10.132.20, 56 bytes of data.

```
64 bytes from 10.10.132.20: icmp_seq=0, time=0ms
64 bytes from 10.10.132.20: icmp_seq=1, time=0ms
64 bytes from 10.10.132.20: icmp_seq=2, time=0ms
64 bytes from 10.10.132.20: icmp_seq=3, time=0ms
64 bytes from 10.10.132.20: icmp_seq=4, time=0ms
Sent 5 packets, received 5 OK, 0 bad
```

The IP Address and Ping Size Parameters of the issued ICMP packets (for ICMP Ping) can be configured.

### Web GUI: Diagnostics > Ping (IPv4)

#### Ping (IPv4)

Fill in the parameters as needed and press "Start" to initiate the Ping session.

|                                 |                                 |                                                      |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hostname or IP Address       | The address of the destination host, either as a symbolic hostname or an IP Address.                                                                                                                                                                                                                                                                                                                   |
| Payload Size                 | Determines the size of the ICMP data payload in bytes (excluding the size of Ethernet, IP and ICMP headers). The default value is 56 bytes. The valid range is 2-1452 bytes.                                                                                                                                                                                                                           |
| Payload Data Pattern         | Determines the pattern used in the ICMP data payload. The default value is 0. The valid range is 0-255.                                                                                                                                                                                                                                                                                                |
| Packet Count                 | Determines the number of PING requests sent. The default value is 5. The valid range is 1-60.                                                                                                                                                                                                                                                                                                          |
| TTL Value                    | Determines the Time-To-Live /TTL) field value in the IPv4 header. The default value is 64. The valid range is 1-255.                                                                                                                                                                                                                                                                                   |

### 6.1.2 Ping IPv6

R Class series allow you to issue ICMPv6 PING packets to troubleshoot IPv6 connectivity issues. After you press Start, ICMPv6 packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs

#### Web GUI: Diagnostics > Ping (IPv6)

##### Ping (IPv6)

Fill in the parameters as needed and press "Start" to initiate the Ping session.

64 bytes from fe80::219:5bff:fe2f:b47: icmp_seq=1, time=0ms
64 bytes from fe80::215:58ff:feed:69dd: icmp_seq=1, time=0ms
64 bytes from fe80::219:5bff:fe2f:b47: icmp_seq=2, time=0ms
64 bytes from fe80::215:58ff:feed:69dd: icmp_seq=2, time=0ms
```

64 bytes from fe80::219:5bff:fe2f:b47: icmp\_seq=3, time=0ms  
 64 bytes from fe80::215:58ff:feed:69dd: icmp\_seq=3, time=0ms  
 64 bytes from fe80::219:5bff:fe2f:b47: icmp\_seq=4, time=0ms  
 64 bytes from fe80::215:58ff:feed:69dd: icmp\_seq=4, time=0ms

Sent 5 packets, received 10 OK, 0 bad

You can configure the following properties of the issued ICMP packets

**Table 6-2: ICMP PING Parameters**

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address                          | The destination IP Address.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Ping Length                         | The payload size of the ICMP packet. Values range from 2 bytes to 1452 bytes.                                                                                                                                                                                                                                                                                                                                                     |
| Ping Count                          | The count of the ICMP packet. Values range from 1 time to 60 times.                                                                                                                                                                                                                                                                                                                                                               |
| Ping Interval                       | The interval of the ICMP packet. Values range from 0 second to 30 seconds.                                                                                                                                                                                                                                                                                                                                                        |
| Egress Interface<br>(Only for IPv6) | The VLAN ID (VID) of the specific egress IPv6 interface which ICMP packet goes. The given VID ranges from 1 to 4094 and will be effective only when the corresponding IPv6 interface is valid. When the egress interface is not given, PING6 finds the best match interface for destination.<br><br>Do not specify egress interface for loopback address.<br><br>Do specify egress interface for link-local or multicast address. |
| Buttons                             | <b>Start:</b> Click to start transmitting ICMP packets.<br><br><b>New Ping:</b> Click to re-start diagnostics with PING.                                                                                                                                                                                                                                                                                                          |

### 6.1.3 Link OAM MIB Retrieval

This procedure allows the user to retrieve the local or remote OAM MIB variable data on a particular port.

- 1 Select the appropriate radio button and enter the port number of the switch to retrieve the content of interest.
- 2 Click on **Start** to retrieve the content.
- 3 Click on **New Retrieval** to retrieve another content of interest.

**Web GUI: Diagnostics > Link OAM > MIB Retrieval**

### 6.1.4 VeriPHY Cable Diagnostics

This section is used for running the VeriPHY Cable Diagnostics for 10/100 and 1G copper ports.

**Web GUI: Diagnostics > VeriPHY**

**VeriPHY Cable Diagnostics**

Port All ▾  
 Start

| Cable Status |        |          |        |          |        |          |        |          |
|--------------|--------|----------|--------|----------|--------|----------|--------|----------|
| Port         | Pair A | Length A | Pair B | Length B | Pair C | Length C | Pair D | Length D |
| 21           | OK     | 0        | OK     | 0        | OK     | 0        | OK     | 0        |

**Figure 6-4: Copper Link Test Cable Status Diagnostics**

Press **Start** to run the diagnostics. This will take approximately 5 seconds. If all ports are selected, this can take approximately 15 seconds. When completed, the page refreshes automatically, and you can view the cable diagnostics results in the cable status table.

Note that VeriPHY is only accurate for cables of length 7 — 140 meters.

10 and 100 Mbps ports will be linked down while running VeriPHY. Therefore, running VeriPHY on a 10 or 100 Mbps management port will cause the switch to stop responding until VeriPHY is complete

**Table 6-3: Copper Link Test Cable Diagnostics Parameters**

|              |                                                                                                                                                                                                                                                                                                                                                                  |

# 7 Maintenance

The Maintenance includes the following procedure:

- Restart Device
- Factory Default
- System Update
- Configuration (Save/Upload)

## 7.1 Restart Device

*You can restart the switch here. After restart, the switch will boot normally. Web GUI: Maintenance > Restart Device*

### Restart Device

**Figure 7-1: Restart Device Screen**

**Table 7-1: Restart Device Parameters**

|      |                                                            |
|------|------------------------------------------------------------|
| Yes: | Click to restart device.                                   |
| No:  | Click to return to the Port State page without restarting. |

## 7.2 Factory Defaults

You can reset the configuration of the switch. Only the IP configuration is retained.

The new configuration is available immediately, which means that no restart is necessary.

**Web GUI: Maintenance > Factory Defaults**

### Factory Defaults

**Figure 7-2: Restore to Factory Defaults Screen**

**Table 7-2: Restore to Factory Defaults Parameters**

|      |                                                                               |
|------|-------------------------------------------------------------------------------|
| Yes: | Click to reset the configuration to Factory Defaults.                         |
| No:  | Click to return to the Port State screen without resetting the configuration. |

*Note: Restoring factory default can also be performed by making a physical loopback between port 1 and port 2 within the first minute from switch reboot. In the first minute after boot, 'loopback' packets will be transmitted at port 1. If a 'loopback' packet is received at port 2 the switch will do a restore to default*

## 7.3 Software Management

This section facilitates an update of the firmware controlling the switch.

**Web GUI: Maintenance > Software > Upload**

### Software Upload

**Figure 7-3: Software Upload**

**Table 7-3: Software Upload Parameters**

|                                                                                                                                                                     |                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type:                                                                                                                                                               | Select the type of image file to upload: <ul style="list-style-type: none"> <li>- SW only: ASIC image only (file_name.gz)</li> <li>- FPGA only: FPGA image only (file_name.rbf)</li> <li>- All: a combined file</li> </ul> |
| Select File:                                                                                                                                                        | Browse to the location of the image file and click <b>Select</b> .                                                                                                                                                         |
| Start Upgrade                                                                                                                                                       | Click to start the upgrade                                                                                                                                                                                                 |
| After the image is uploaded, a page announces that the firmware update is initiated. After a few moments, the software/firmware is updated and the switch restarts. |                                                                                                                                                                                                                            |

**Warning:** While the firmware is being updated, Web access appears to be defunct. The front LED flashes Green/Off with a frequency of 10 Hz while the firmware update is in progress. **Do not restart or power off the device at this time** or the switch may fail to function afterwards.

### 7.3.1 Software Image Select

This section provides information about the active and alternate (backup) firmware images in the device and allows you to revert to the alternate image. The web page displays two tables with information about the active and alternate firmware images.

**Web GUI: Maintenance > Software > Image Select**

**Software Image Selection**

| Active Image |                           |
|--------------|---------------------------|
| Image        | mmcbk0p1                  |
| Version      | 8.0.2.4                   |
| Date         | 2021-03-17T15:18:02+02:00 |

| Alternate Image |                           |
|-----------------|---------------------------|
| Image           | mmcbk0p2                  |
| Version         | 8.0.2.3                   |
| Date            | 2021-03-11T11:14:23+02:00 |

**Figure 7-4: Software Image Selection**

**Table 7-4: Software Image Selection Parameters**

|         |                                                                                                                                                                                                                           |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Image   | The file name of the firmware image, from when the image was last updated.                                                                                                                                                |
| Version | The version of the firmware image.                                                                                                                                                                                        |
| Date    | The date where the firmware was produced.                                                                                                                                                                                 |
| Buttons | <p><b>Activate Alternate Image:</b> Click to use the alternate image. This button may be disabled depending on system state.</p> <p><b>Cancel:</b> Cancel activating the backup image. Navigates away from this page.</p> |

## 7.4 Configuration Management

The switch stores its configuration in several text files in CLI format. The files are either virtual (RAM-based) or stored in flash on the switch. The available files are:

- **Running-config:** A virtual file that represents the currently active configuration on the switch. This file is volatile.
- **Startup-config:** The startup configuration for the switch, read at boot time. If this file doesn't exist at boot time, the switch will start up in default configuration
- **Default-config:** A read-only file with vendor-specific configuration. This file is read when the system is restored to default settings
- **Up to 31 other files,** typically used for configuration backups or alternative configurations.

### 7.4.1 Save startup configuration

This copies *running-config* to *startup-config*, thereby ensuring that the currently active configuration will be used at the next reboot.

**Web GUI: Maintenance > Configuration > Save Startup Config**

#### Save Running Configuration to startup-config

Please note: The generation of the configuration file may be time consuming, depending on the amount of non-default configuration.

Save Configuration

**Figure 7-5: Save Startup Configuration File**

### 7.4.2 Download Configuration

It is possible to download any of the files on the switch to the web browser. Select the file and click **Download Configuration**. Download of *running-config* may take a little while to complete, as the file must be prepared for download.

**Web GUI: Maintenance > Configuration > Download**

#### Download Configuration

Select configuration file to save.

Please note: *running-config* may take a while to prepare for download.

| File Name                                       |
|-------------------------------------------------|
| <input type="radio"/> running-config            |
| <input checked="" type="radio"/> default-config |
| <input type="radio"/> startup-config            |

Download Configuration

**Figure 7-6: Download Configuration**

### 7.4.3 Upload Configuration

**Web GUI: Maintenance > Configuration > Upload**

## Upload Configuration

### File To Upload

### Destination File

| File Name                             | Parameters                                                           |
|---------------------------------------|----------------------------------------------------------------------|
| <input type="radio"/> running-config  | <input checked="" type="radio"/> Replace <input type="radio"/> Merge |
| <input type="radio"/> startup-config  |                                                                      |
| <input type="radio"/> Create new file | <input type="text"/>                                                 |

**Figure 7-7: Upload Configuration**

It is possible to upload a file from the web browser to all the files on the switch, except *default-config* which is read-only. Select the file to upload, select the destination file on the target, then click **Upload Configuration**. If the destination is *running-config*, the file will be applied to the switch configuration. This can be done in two ways:

- **Replace mode:** The current configuration is fully replaced with the configuration in the uploaded file.
- **Merge mode:** The uploaded file is merged into *running-config*.

If the flash file system is full (i.e., contains *default-config* and 32 other files, usually including *startup-config*), it is not possible to create new files. Instead, an existing file must be overwritten or another file must be deleted.

## 7.4.4 Activate

It is possible to activate any of the configuration files present on the switch, except for *running-config* which represents the currently active configuration.

Select the file to activate and click **Activate Configuration**. This will initiate the process of completely replacing the existing configuration with that of the selected file.

**Web GUI: Maintenance > Configuration > Activate**

| File Name                            |
|--------------------------------------|
| <input type="radio"/> default-config |
| <input type="radio"/> startup-config |

**Figure 7-8: Activate Configuration**

## 7.4.5 Delete

It is possible to delete any of the writable files stored in flash, including *startup-config*. If this is done and the switch is rebooted without a prior Save operation, this effectively resets the switch to default configuration.

### Web GUI: Maintenance > Configuration > Delete

Select configuration file to delete.

| File Name                            |
|--------------------------------------|
| <input type="radio"/> startup-config |

Delete Configuration File

Figure 7-9: Delete Configuration

## 7.5 Power Supply Overview

Warning

ONLY the Fibrolan Power Supply (AC or DC) is suitable to be used with the R Class series unit.

Any other PS module (Fibrolan products or other), even if mechanically matching, may cause irreversible damage to the system.

IN SUCH CASES THIS WILL VOID ANY WARRANTY!

Warning

NEVER OPEN THE DEVICE WHEN IT IS CONNECTED TO POWER LINES!

Caution

When connecting a device to an AC (DC) power outlet, always:

1. First connect the power cord to the device (ensure that it is securely fastened).
2. Only after connecting the power cord to the device, it should be plugged into the wall outlet. Make sure to use grounded (3 way) outlets (for AC models).

---

*Note: For most countries Fibrolan ships an appropriate power supply cord which is safety approved in accordance with the country's National Electric Code.*

*For certain countries Products are shipped without power cords. In such cases, locally purchased safety approved power cords (in accordance with that country's National Electric Code) may be used.*

---

### 7.5.1 AC Power Supply

Connect AC line voltage using the power supply cords provided (alternatively you may use other 18AWG three wire cord). R Class devices will accept any line voltage from 100 to 240 VAC, 50-60 Hz. There is no ON/OFF switch on the device. When the power is connected to the device, the device is ON. This will be indicated by the Power (PWR) LED lit green on the front panel. The PS is rated for ambient temperature of: -10°C ÷ +50°C.

125VDC Connection: In this case, the supplied AC cable allows the connection to an external DC source of 125VDC.

## 7.5.2 DC Power Supplies

Connect DC line voltage using the power supply cords provided (alternatively you may use other 18AWG three wire cord). R Class devices will accept any line voltage from 20 to–60VDC. There is no ON/OFF switch on the device. When the power is connected to the device, the device is ON. This will be indicated by the Power (PWR) LED lit green on the front panel.

---

*Note: The earthen conductor of power cord must be grounded.*

---

### –20 to – 60VDC Power Connection

The rear panel is equipped with a suitable screw connection (ST connector).

**Figure 7-10: Falcon-RX series DC PS rear panel ST connector**

DC powered models: Required current rating = 2A

### CAUTION DOUBLE POLE FUSING

Verify that the DC-Mains provide a 2 Amp double pole circuit breaker. Required power conductor size = at least 0.75mm<sup>2</sup> for flexible cable or 1mm<sup>2</sup> for non-flexible. Power Consumption (AC and DC Power Supplies):

- Falcon-RX
  - Maximum <12W
  - Typical: <10W
- nFalcon-R:
  - Maximum <20W
  - Typical: <15W
- Falcon-RX:
  - Maximum <60W
  - Typical: <50W

---

*Falcon-RX device include Dual redundant, hot swappable power supplies*

---

## 7.6 Laser Safety

|                                                                                   |                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Laser Warning                                                                     | CAUTION! Radiation emitted from fiber optic ports may be hazardous to human vision. Therefore, the following rules must be strictly observed:                                                                                                                                                                                                 |
|  | <p>All single-mode (SM) models are CLASS I LASER PRODUCT that may endanger your eyes and must be handled with special care. When not in use, keep the fiber optic connector closed using its protective cover.</p> <p>Never stare directly into the fiber optic connector of a powered device or into the end of a fiber connected to it.</p> |
| Laser Safety                                                                      | <p>The emissions produced by the end products described in this guide are under Class 1 emission level according to IEC 60825-1 2007</p> <p>These products shall not be installed in an optical network handling above Class 1 level</p>                                                                                                      |

# 8 Warranty Information

## 8.1 Warranty Limitation

Fibrolan warrants the equipment to be free from defects in material and workmanship, under normal and proper use and in its unmodified condition for 24 months (**unless otherwise agreed upon**) starting on the date of delivery from Fibrolan to its distributor.

Fibrolan's sole obligation under this warranty shall be to furnish parts and labor for the repair or replacement of products found by Fibrolan to be defective in material or workmanship during the warranty period. Warranty repairs will be performed at the point of manufacture.

Following an authorized repair, the device shall be under warranty throughout its original period but not less than 3 months. Warranty shall be void in case where unauthorized attempts to repair or disassemble/modify the device are evident.

You must claim repairs or replacements under this warranty only from the reseller from which you have purchased the device, however you may refer directly to Fibrolan Ltd. To claim the warranty, you should provide a reasonable proof that the reseller ceased operation and/or unreasonably refused to provide you with the service.

In such case report to Fibrolan the serial number of the device, date purchased, full details of reseller from whom the device was purchase and a copy of an invoice or another proof of the purchase.

---

*Note: This document and the information contained herein are proprietary of the manufacturer and are furnished to the recipient for use in operating, maintaining and repairing manufacturer equipment. The information within may not be utilized for any purpose except as stated herein and may not be disclosed to third parties without the written permission from the manufacturer.*

*The manufacturer reserves the right to make changes to any technical specifications in order to improve reliability, function and design.*

# 9 Glossary of Terms

## 9.1 General Glossary of Terms

| <b>9.2 General Glossary of Terms</b> |                                                        |
|--------------------------------------|--------------------------------------------------------|
| Acronym                              | Description                                            |
| ACL                                  | Access Control List                                    |
| AIS                                  | Alarm Indication Signal                                |
| ALD                                  | Autonomous Link Discovery                              |
| ARP                                  | Address Resolution Protocol                            |
| BPDU                                 | Bridge Protocol Data Unit                              |
| CBWFQ                                | Frame Lost Weighted Fair Queuing                       |
| CC                                   | Continuity Check                                       |
| CCM                                  | Continuity Check Message                               |
| CDP                                  | Cisco Discovery Protocol                               |
| CE                                   | Customer Edge (Equipment)                              |
| CFM                                  | Connectivity Fault Management (IEEE 802.1ag)           |
| CIR                                  | Committed Insured Rate                                 |
| CLI                                  | Command Line Interface                                 |
| CLNP                                 | Connectionless Network Protocol                        |
| CMIP                                 | Common Management Info Protocol                        |
| CoS                                  | Class of Service                                       |
| CPE                                  | Customer Premises Equipment                            |
| CSF                                  | Client Signal Fail                                     |
| CSMA/CD                              | Carrier Sense Multiple Access with Collision Detection |
| DES                                  | Data Encryption Standard                               |
| DHCP                                 | Dynamic Host Configuration Protocol                    |
| DM                                   | Delay measurement                                      |
| DMAC                                 | Destination MAC address                                |
| DMM                                  | Delay Measurement Message                              |

## 9.2 General Glossary of Terms

| Acronym  | Description                                                                                                            |
|----------|------------------------------------------------------------------------------------------------------------------------|
| DMR      | Delay Measurement Reply                                                                                                |
| DNS      | Domain Name System                                                                                                     |
| DSCP     | Differentiated Services Code Point                                                                                     |
| EAP      | Extensible Authentication Protocol                                                                                     |
| ECFM     | Ethernet Connectivity Fault Management                                                                                 |
| EEC      | Synchronous Ethernet Equipment clock                                                                                   |
| EFM      | Ethernet in the First Mile                                                                                             |
| EMS      | Element Management System                                                                                              |
| ELPS     | Ethernet Linear Protection Switching                                                                                   |
| ERPS     | Ethernet Ring Protection Switching                                                                                     |
| EVC      | Ethernet Virtual Connection                                                                                            |
| EVPL     | Ethernet Virtual Private Line                                                                                          |
| FD       | Frame Delay                                                                                                            |
| FDV      | Frame delay variation                                                                                                  |
| FDX      | Full Duplex                                                                                                            |
| FEF      | Far End Fault                                                                                                          |
| FP       | Fault Propagation                                                                                                      |
| FTP      | File Transfer Protocol                                                                                                 |
| FTTB     | Broadband Access Over Fiber                                                                                            |
| FTTB MDU | Broadband Access Over Fiber Multi Dwelling Unit                                                                        |
| Gbps     | Gigabits per second                                                                                                    |
| HDLC     | High-Level Data Link Control                                                                                           |
| HDX      | Half Duplex                                                                                                            |
| FDX      | Full Duplex                                                                                                            |
| HTML     | Hypertext Markup Language                                                                                              |
| HTTP     | Hypertext Transfer Protocol                                                                                            |
| HTTPS    | Hypertext Transfer Protocol over Secure Socket Layer                                                                   |
| ICMP     | Internet Control Message Protocol                                                                                      |
| IEEE     | Institute of Electronic and Electronic Engineers developing the standards for communications and networks. IEEE Number |

## 9.2 General Glossary of Terms

| Acronym                | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |

| MIP         | Maintenance Immediate Point                                                                                     |
| MNCP        | Maximum Number of Cells Packed                                                                                  |

## 9.2 General Glossary of Terms

| Acronym       | Description                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------|
| MPLS          | Multi-Protocol Label Switching                                                                    |
| MPLS-TP       | MPLS Transport Profile                                                                            |
| MTTR          | Mean time to repair                                                                               |
| MTU           | Maximum Transmission Unit                                                                         |
| MTU-s         | Multi Tenant Unit- switch                                                                         |
| NCP           | Netware Core Protocol                                                                             |
| NetBIOS       | Network Basic Input/Output System                                                                 |
| NFS           | Network File System                                                                               |
| NGN           | Next Generation Network                                                                           |
| NGN Access    | Next Generation Network Access                                                                    |
| NIC           | Network Interface Card                                                                            |
| NMS           | Network Management System                                                                         |
| NTP           | Network Time Protocol                                                                             |
| NTU           | Network Termination Unit                                                                          |
| NU            | Node Unit                                                                                         |
| OA            | Operation and Administration,                                                                     |
| OAM           | Operation, Administration, Management                                                             |
| ODI           | Open Data-link Interface                                                                          |
| OpEx          | Operating Expenditures                                                                            |
| Optional TLVs | A LLDP frame contains multiple TLVs                                                               |
| OSI           | Open System Interconnection                                                                       |
| OSPF          | Open Shortest Path First                                                                          |
| OUI           | Organization Unique Identifier                                                                    |
| PE            | Provider Edge                                                                                     |
| PM            | Performance monitoring                                                                            |
| PRC           | Primary Reference Clock                                                                           |
| PIR           | Peak Information Rate                                                                             |
| Policer       | A Policer can limit the bandwidth of received frames. It is located in front of the ingress queue |
| POST          | Power-on Self Test                                                                                |

## 9.2 General Glossary of Terms

| Acronym      | Description                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PPP          | Point-to-Point Protocol                                                                                                                                                                    |
| Private VLAN | In a private VLAN, communication between ports in that private VLAN is not permitted. A VLAN can be configured as a private VLAN                                                           |
| PW           | Pseudowire                                                                                                                                                                                 |
| QCE          | Quality of Service Control List Entries                                                                                                                                                    |
| QCL          | Quality of Service Control List                                                                                                                                                            |
| Q-in-Q       | Selective Q-in-Q per IEEE802.1ad Provider Bridging                                                                                                                                         |
| QoS          | Quality of Service                                                                                                                                                                         |
| RADIUS       | Remote Authentication Dial In User Service                                                                                                                                                 |
| RARP         | Reverse Address Resolution Protocol                                                                                                                                                        |
| RDI          | Remote Defect Indication                                                                                                                                                                   |
| RIP          | Routing Information Protocol                                                                                                                                                               |
| RMON         | Remote Monitoring                                                                                                                                                                          |
| RSTP         | Rapid Spanning Tree Protocol (IEEE 802.1w)                                                                                                                                                 |
| Rx           | Receive                                                                                                                                                                                    |
| SFP          | Small Form-factor Pluggable                                                                                                                                                                |
| SLA          | Service Level Management                                                                                                                                                                   |
| SLE          | Subscriber Link Emulation                                                                                                                                                                  |
| SMAC         | Source MAC address                                                                                                                                                                         |
| SNMP         | Simple Network Management Protocol                                                                                                                                                         |
| SPX          | Sequenced Packet Exchange                                                                                                                                                                  |
| SSH          | An acronym for <b>Secure Shell</b> . It is a network protocol that allows data to be exchanged using a secure channel between two networked devices.                                       |
| SSM          | Synchronization Status Messages                                                                                                                                                            |
| STA          | Spanning Tree Algorithm                                                                                                                                                                    |
| STP          | Spanning Tree Protocol                                                                                                                                                                     |
| SU           | Subscriber Unit                                                                                                                                                                            |
| SyncE        | Is an abbreviation for Synchronous Ethernet. This functionality is used to make a network 'clock frequency' synchronized. Not to be confused with real time clock synchronized (IEEE 1588) |
| TACACS+      | Terminal Access Controller Access Control System Plus                                                                                                                                      |

## 9.2 General Glossary of Terms

| Acronym | Description                                                                                                                                                                                                                                                                                                                      |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCM     | Three Color Marker                                                                                                                                                                                                                                                                                                               |
| TCO     | Total cost of ownership                                                                                                                                                                                                                                                                                                          |
| TCP     | Transmission Control Protocol                                                                                                                                                                                                                                                                                                    |
| TDM     | Time Division Multiplexing                                                                                                                                                                                                                                                                                                       |
| Telnet  | Standard terminal emulation protocol in the TCP/IP protocol stack                                                                                                                                                                                                                                                                |
| TFTP    | It is an acronym for <b>T</b> rivial <b>F</b> ile <b>T</b> ransfer <b>P</b> rotocol. It is transfer protocol that uses the User Datagram Protocol (UDP) and provides file writing and reading,                                                                                                                                   |
| TLV     | It is an acronym for <b>T</b> ype <b>L</b> ength <b>V</b> alue. A LLDP frame can contain multiple pieces of information. Each of these pieces of information is known as TLV                                                                                                                                                     |
| ToS     | It is an acronym for <b>T</b> ype <b>o</b> f <b>S</b> ervice. It is implemented as the IPv4 ToS priority control. It is fully decoded to determine the priority from the 6-bit ToS field in the IP header.                                                                                                                       |
| TrTCM   | Two rate Three Color Marker                                                                                                                                                                                                                                                                                                      |
| TTL     | Time To Live                                                                                                                                                                                                                                                                                                                     |
| TST     | Test PDU                                                                                                                                                                                                                                                                                                                         |
| Tx      | Transmit                                                                                                                                                                                                                                                                                                                         |
| UI      | User Interface                                                                                                                                                                                                                                                                                                                   |
| UNI     | User Network Interface                                                                                                                                                                                                                                                                                                           |
| UPnP    | It is an acronym for <b>U</b> niversal <b>P</b> lug and <b>P</b> lay. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components |
| UTC     | Coordinated Universal Time/International Atomic Time                                                                                                                                                                                                                                                                             |
| VLAN    | Virtual Local Area Network                                                                                                                                                                                                                                                                                                       |
| VLAN ID | VLAN Identifier                                                                                                                                                                                                                                                                                                                  |
| WAN     | Wide Area Network                                                                                                                                                                                                                                                                                                                |
| WDM     | Wavelength-division multiplexing                                                                                                                                                                                                                                                                                                 |

## 9.3 Alphabetical Glossary of Terms

### ACE

ACE is an acronym for Access Control Entry. It describes access permission associated with a particular ACE ID.

There are three ACE frame types (Ethernet Type, ARP, and IPv4) and two ACE actions (permit and deny). The ACE also contains many detailed, different parameter options that are available for individual application.

### ACL

ACL is an acronym for Access Control List. It is the list table of ACEs, containing access control entries that specify individual users or groups permitted or denied to specific traffic objects, such as a process or a program.

Each accessible traffic object contains an identifier to its ACL. The privileges determine whether there are specific traffic object access rights.

ACL implementations can be quite complex, for example, when the ACEs are prioritized for the various situation. In networking, the ACL refers to a list of service ports or network services that are available on a host or server, each with a list of hosts or servers permitted or denied to use the service. ACL can generally be configured to control inbound traffic, and in this context, they are similar to firewalls.

There are 3 web-pages associated with the manual ACL configuration:

- ACL|Access Control List: The web page shows the ACEs in a prioritized way, highest (top) to lowest (bottom). Default the table is empty. An ingress frame will only get a hit on one ACE even though there are more matching ACEs. The first matching ACE will take action (permit/deny) on that frame and a counter associated with that ACE is incremented. An ACE can be associated with a Policy, 1 ingress port, or any ingress port (the whole switch). If an ACE Policy is created then that Policy can be associated with a group of ports under the "Ports" web-page. There are number of Parameters that can be configured with an ACE. Read the Web page help text to get further information for each of them. The maximum number of ACEs is 64.
- ACL|Ports: The ACL Ports configuration is used to assign a Policy ID to an ingress port. This is useful to group ports to obey the same traffic rules. Traffic Policy is created under the "Access Control List" - page. You can you also set up specific traffic properties (Action / Rate Limiter / Port copy, etc) for each ingress port. They will though only apply if the frame gets past the ACE matching without getting matched. In that case a counter associated with that port is incremented. See the Web page help text for each specific port property
- ACL|Rate Limiters: Under this page you can configure the rate limiters. There can be 15 different rate limiters, each ranging from 1-1024K packets per seconds. Under "Ports" and "Access Control List" web-pages you can assign a Rate Limiter ID to the ACE(s) or ingress port(s).

### AES

AES is an acronym for Advanced Encryption Standard. The encryption key protocol is applied in 802.1i standard to improve WLAN security. It is an encryption standard by the U.S. government, which will replace DES and 3DES. AES has a fixed block size of 128 bits and a key size of 128, 192, or 256 bits.

## **AMS**

AMS is an acronym for Auto Media Select. AMS is used for dual media ports (ports supporting both copper (cu) and fiber (SFP) cables. AMS automatically determines if a SFP or a CU cable is inserted and switches to the corresponding media. If both SFP and cu cables are inserted, the port will select the preferred media.

## **APS**

APS is an acronym for Automatic Protection Switching. This protocol is used to secure that switching is done bidirectional in the two ends of a protection group, as defined in G.8031.

## **Aggregation**

Using multiple ports in parallel to increase the link speed beyond the limits of a port and to increase the redundancy for higher availability.

(Also Port Aggregation, Link Aggregation).

## **ARP**

ARP is an acronym for Address Resolution Protocol. It is a protocol that used to convert an IP address into a physical address, such as an Ethernet address. ARP allows a host to communicate with other hosts when only the Internet address of its neighbors is known. Before using IP, the host sends a broadcast ARP request containing the Internet address of the desired destination system.

## **ARP Inspection**

ARP Inspection is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through the switch device.

## **Auto-Negotiation**

Auto-negotiation is the process where two different devices establish the mode of operation and the speed settings that can be shared by those devices for a link.

## **CC**

CC is an acronym for Continuity Check. It is a MEP functionality that is able to detect loss of continuity in a network by transmitting CCM frames to a peer MEP.

## **CCM**

CCM is an acronym for Continuity Check Message. It is a OAM frame transmitted from a MEP to it's peer MEP and used to implement CC functionality.

## **CDP**

CDP is an acronym for Cisco Discovery Protocol.

## **DEI**

DEI is an acronym for Drop Eligible Indicator. It is a 1-bit field in the VLAN tag.

## **DES**

DES is an acronym for Data Encryption Standard. It provides a complete description of a mathematical algorithm for encrypting (enciphering) and decrypting (deciphering) binary coded information.

Encrypting data converts it to an unintelligible form called cipher. Decrypting cipher converts the data back to its original form called plaintext. The algorithm described in this standard specifies both enciphering and deciphering operations which are based on a binary number called a key.

## **DHCP**

DHCP is an acronym for Dynamic Host Configuration Protocol. It is a protocol used for assigning dynamic IP addresses to devices on a network.

DHCP used by networked computers (clients) to obtain IP addresses and other Parameters such as the default gateway, subnet mask, and IP addresses of DNS servers from a DHCP server.

The DHCP server ensures that all IP addresses are unique, for example, no IP address is assigned to a second client while the first client's assignment is valid (its lease has not expired). Therefore, IP address pool management is done by the server and not by a human network administrator.

Dynamic addressing simplifies network administration because the software keeps track of IP addresses rather than requiring an administrator to manage the task. This means that a new computer can be added to a network without the hassle of manually assigning it a unique IP address.

## **DHCP Relay**

DHCP Relay is used to forward and to transfer DHCP messages between the clients and the server when they are not on the same subnet domain.

The DHCP option 82 enables a DHCP relay agent to insert specific information into a DHCP request packets when forwarding client DHCP packets to a DHCP server and remove the specific information from a DHCP reply packets when forwarding server DHCP packets to a DHCP client. The DHCP server can use this information to implement IP address or other assignment policies. Specifically the option works by setting two sub-options: Circuit ID (option 1) and Remote ID (option2). The Circuit ID sub-option is supposed to include information specific to which circuit the request came in on. The Remote ID sub-option was designed to carry information relating to the remote host end of the circuit.

The definition of Circuit ID in the switch is 4 bytes in length and the format is "vlan\_id" "module\_id" "port\_no". The parameter of "vlan\_id" is the first two bytes represent the VLAN ID. The parameter of "module\_id" is the third byte for the module ID (in standalone switch it always equal 0, in stackable switch it means switch ID). The parameter of "port\_no" is the fourth byte and it means the port number.

The Remote ID is 6 bytes in length, and the value is equal the DHCP relay agents MAC address.

## **DHCP Snooping**

DHCP Snooping is used to block intruder on the untrusted ports of the switch device when it tries to intervene by injecting a bogus DHCP reply packet to a legitimate conversation between the DHCP client and server.

## **DNS**

DNS is an acronym for Domain Name System. It stores and associates many types of information with domain names. Most importantly, DNS translates human-friendly domain names and computer hostnames into computer-friendly IP addresses. For example, the domain name `www.example.com` might translate to `192.168.0.1`.

## **DoS**

DoS is an acronym for Denial of Service. In a denial-of-service (DoS) attack, an attacker attempts to prevent legitimate users from accessing information or services. By targeting at network sites or network connection, an attacker may be able to prevent network users from accessing email, web sites, online accounts (banking, etc.), or other services that rely on the affected computer.

## **Dotted Decimal Notation**

Dotted Decimal Notation refers to a method of writing IP addresses using decimal numbers and dots as separators between octets. An IPv4 dotted decimal address has the form `x.y.z.w`, where `x`, `y`, `z`, and `w` are decimal numbers between 0 and 255.

## **Drop Precedence Level**

Every incoming frame is classified to a Drop Precedence Level (DP level), which is used throughout the device for providing congestion control guarantees to the frame according to what was configured for that specific DP level. A DP level of 0 (zero) corresponds to 'Committed' (Green) frames and a DP level of 1 or higher corresponds to 'Discard Eligible' (Yellow) frames.

## **DSCP**

DSCP is an acronym for Differentiated Services Code Point. It is a field in the header of IP packets for packet classification purposes.

## **EEE**

EEE is an abbreviation for Energy Efficient Ethernet defined in IEEE 802.3az.

## **EPS**

EPS is an abbreviation for Ethernet Protection Switching defined in ITU/T G.8031.

## **Ethernet Type**

Ethernet Type, or EtherType, is a field in the Ethernet MAC header, defined by the Ethernet networking standard. It is used to indicate which protocol is being transported in an Ethernet frame.

## **FTP**

FTP is an acronym for File Transfer Protocol. It is a transfer protocol that uses the Transmission Control Protocol (TCP) and provides file writing and reading. It also provides directory service and security features.

## **Fast Leave**

Multicast snooping Fast Leave processing allows the switch to remove an interface from the forwarding-table entry without first sending out group specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave

message. Fast-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are in use simultaneously. This processing applies to MLD and MLD.

## **HTTP**

HTTP is an acronym for Hypertext Transfer Protocol. It is a protocol that used to transfer or convey information on the World Wide Web (WWW).

HTTP defines how messages are formatted and transmitted, and what actions Web servers and browsers should take in response to various commands. For example, when you enter a URL in your browser, this actually sends an HTTP command to the Web server directing it to fetch and transmit the requested Web page. The other main standard that controls how the World Wide Web works is HTML, which covers how Web pages are formatted and displayed.

Any Web server machine contains, in addition to the Web page files it can serve, an HTTP daemon, a program that is designed to wait for HTTP requests and handle them when they arrive. The Web browser is an HTTP client, sending requests to server machines. An HTTP client initiates a request by establishing a Transmission Control Protocol (TCP) connection to a particular port on a remote host (port 80 by default). An HTTP server listening on that port waits for the client to send a request message.

## **HTTPS**

HTTPS is an acronym for Hypertext Transfer Protocol over Secure Socket Layer. It is used to indicate a secure HTTP connection.

HTTPS provide authentication and encrypted communication and is widely used on the World Wide Web for security-sensitive communication such as payment transactions and corporate logons.

HTTPS is really just the use of Netscape's Secure Socket Layer (SSL) as a sublayer under its regular HTTP application layering. (HTTPS uses port 443 instead of HTTP port 80 in its interactions with the lower layer, TCP/IP.) SSL uses a 40-bit key size for the RC4 stream encryption algorithm, which is considered an adequate degree of encryption for commercial exchange.

## **ICMP**

ICMP is an acronym for Internet Control Message Protocol. It is a protocol that generated the error response, diagnostic or routing purposes. ICMP messages generally contain information about routing difficulties or simple exchanges such as time-stamp or echo transactions. For example, the PING command uses ICMP to test an Internet connection.

## **IEEE 802.1X**

IEEE 802.1X is an IEEE standard for port-based Network Access Control. It provides authentication to devices attached to a LAN port, establishing a point-to-point connection or preventing access from that port if authentication fails. With 802.1X, access to all switch ports can be centrally controlled from a server, which means that authorized users can use the same credentials for authentication from any point within the network.

## **MLD**

MLD is an acronym for Internet Group Management Protocol. It is a communications protocol used to manage the membership of Internet Protocol multicast groups. MLD is used by IP hosts and

adjacent multicast routers to establish multicast group memberships. It is an integral part of the IP multicast specification, like ICMP for unicast connections. MLD can be used for online video and gaming and allows more efficient use of resources when supporting these uses.

### **MLD Querier**

A router sends MLD Query messages onto a particular link. This router is called the Querier.

### **IMAP**

IMAP is an acronym for Internet Message Access Protocol. It is a protocol for email clients to retrieve email messages from a mail server.

IMAP is the protocol that IMAP clients use to communicate with the servers, and SMTP is the protocol used to transport mail to an IMAP server.

The current version of the Internet Message Access Protocol is IMAP4. It is similar to Post Office Protocol version 3 (POP3), but offers additional and more complex features. For example, the IMAP4 protocol leaves your email messages on the server rather than downloading them to your computer. If you wish to remove your messages from the server, you must use your mail client to generate local folders, copy messages to your local hard drive, and then delete and expunge the messages from the server.

### **IP**

IP is an acronym for Internet Protocol. It is a protocol used for communicating data across an internet network.

IP is a "best effort" system, which means that no packet of information sent over is assured to reach its destination in the same condition it was sent. Each device connected to a Local Area Network (LAN) or Wide Area Network (WAN) is given an Internet Protocol address, and this IP address is used to identify the device uniquely among all other devices connected to the extended network.

The current version of the Internet protocol is IPv4, which has 32-bits Internet Protocol addresses allowing for in excess of four billion unique addresses. This number is reduced drastically by the practice of webmasters taking addresses in large blocks, the bulk of which remain unused. There is a rather substantial movement to adopt a new version of the Internet Protocol, IPv6, which would have 128-bits Internet Protocol addresses. This number can be represented roughly by a three with thirty-nine zeroes after it. However, IPv4 is still the protocol of choice for most of the Internet.

### **IPMC**

IPMC is an acronym for IP MultiCast.

IPMC supports IPv4 and IPv6 multicasting. IPMCv4 denotes multicast for IPv4. IPMCv6 denotes multicast for IPv6.

### **IP Source Guard**

IP Source Guard is a secure feature used to restrict IP traffic on DHCP snooping untrusted ports by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host.

## **LACP**

LACP is an IEEE 802.3ad standard protocol. The **L**ink **A**ggregation **C**ontrol **P**rotocol, allows bundling several physical ports together to form a single logical port.

## **LLC**

The IEEE 802.2 **L**ogical **L**ink **C**ontrol (LLC) protocol provides a link mechanism for upper layer protocols. It is the upper sub-layer of the Data Link Layer and provides multiplexing mechanisms that make it possible for several network protocols (IP, IPX) to coexist within a multipoint network. LLC header consists of 1-byte DSAP (Destination Service Access Point), 1 byte SSAP (Source Service Access Point), 1 or 2 bytes Control field followed by LLC information.

## **LLDP**

LLDP is an IEEE 802.1ab standard protocol.

The **L**ink **L**ayer **D**iscovery **P**rotocol (LLDP) specified in this standard allows stations attached to an IEEE 802 LAN to advertise, to other stations attached to the same IEEE 802 LAN, the major capabilities provided by the system incorporating that station, the management address or addresses of the entity or entities that provide management of those capabilities, and the identification of the stations point of attachment to the IEEE 802 LAN required by those management entity or entities. The information distributed via this protocol is stored by its recipients in a standard Management Information Base (MIB), making it possible for the information to be accessed by a Network Management System (NMS) using a management protocol such as the Simple Network Management Protocol (SNMP).

## **LLDP-MED**

LLDP-MED is an extension of IEEE 802.1ab and is defined by the telecommunication industry association (TIA-1057).

## **LOC**

LOC is an acronym for Loss Of Connectivity and is detected by a MEP and is indicating lost connectivity in the network. Can be used as a switch criteria byEPS

## **MAC Table**

Switching of frames is based upon the DMAC address contained in the frame. The switch builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should go to ( based upon the DMAC address in the frame ). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address ( SMAC address ), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address have been seen after a configurable age time.

## **MEP**

MEP is an acronym for Maintenance Entity Endpoint and is an endpoint in a Maintenance Entity Group (ITU-T Y.1731).

## **MD5**

MD5 is an acronym for Message-Digest algorithm 5. MD5 is a message digest algorithm, used cryptographic hash function with a 128-bit hash value. It was designed by Ron Rivest in 1991. MD5 is officially defined in RFC 1321 - The MD5 Message-Digest Algorithm.

## **Mirroring**

For debugging network problems or monitoring network traffic, the switch system can be configured to mirror frames from multiple ports to a mirror port. (In this context, mirroring a frame is the same as copying the frame.)

Both incoming (source) and outgoing (destination) frames can be mirrored to the mirror port.

## **MLD**

MLD is an acronym for **M**ulticast **L**istener **D**iscovery for IPv6. MLD is used by IPv6 routers to discover multicast listeners on a directly attached link, much as MLD is used in IPv4. The protocol is embedded in ICMPv6 instead of using a separate protocol.

## **MVR**

Multicast VLAN Registration (MVR) is a protocol for Layer 2 (IP)-networks that enables multicast-traffic from a source VLAN to be shared with subscriber-VLANs.

The main reason for using MVR is to save bandwidth by preventing duplicate multicast streams being sent in the core network, instead the stream(s) are received on the MVR-VLAN and forwarded to the VLANs where hosts have requested it/them(Wikipedia).

## **NAS**

NAS is an acronym for Network Access Server. The NAS is meant to act as a gateway to guard access to a protected source. A client connects to the NAS, and the NAS connects to another resource asking whether the client's supplied credentials are valid. Based on the answer, the NAS then allows or disallows access to the protected resource. An example of a NAS implementation is IEEE 802.1X.

## **NetBIOS**

NetBIOS is an acronym for Network Basic Input/Output System. It is a program that allows applications on separate computers to communicate within a Local Area Network (LAN), and it is not supported on a Wide Area Network (WAN).

The NetBIOS giving each computer in the network both a NetBIOS name and an IP address corresponding to a different host name, provides the session and transport services described in the Open Systems Interconnection (OSI) model.

## **NFS**

NFS is an acronym for Network File System. It allows hosts to mount partitions on a remote system and use them as though they are local file systems.

NFS allows the system administrator to store resources in a central location on the network, providing authorized users continuous access to them, which means NFS supports sharing of files, printers, and other resources as persistent storage over a computer network.

## **NTP**

NTP is an acronym for Network Time Protocol, a network protocol for synchronizing the clocks of computer systems. NTP uses UDP (datagrams) as transport layer.

## **OAM**

OAM is an acronym for Operation Administration and Maintenance.

It is a protocol described in ITU-T Y.1731 used to implement carrier ethernet functionality. MEP functionality like CC and RDI is based on this

## **Optional TLVs**

A LLDP frame contains multiple TLVs

For some TLVs it is configurable if the switch shall include the TLV in the LLDP frame. These TLVs are known as optional TLVs. If an optional TLV is disabled the corresponding information is not included in the LLDP frame.

## **OUI**

OUI is the organizationally unique identifier. An OUI address is a globally unique identifier assigned to a vendor by IEEE. You can determine which vendor a device belongs to according to the OUI address which forms the first 24 bits of a MAC address.

## **PCP**

PCP is an acronym for Priority Code Point. It is a 3-bit field storing the priority level for the 802.1Q frame. It is also known as User Priority.

## **PD**

PD is an acronym for Powered Device. In a PoE system the power is delivered from a PSE ( power sourcing equipment ) to a remote device. The remote device is called a PD.

## **PHY**

PHY is an abbreviation for Physical Interface Transceiver and is the device that implements the Ethernet physical layer (IEEE-802.3).

## **PING**

ping is a program that sends a series of packets over a network or the Internet to a specific computer in order to generate a response from that computer. The other computer responds with an acknowledgment that it received the packets. Ping was created to verify whether a specific computer on a network or the Internet exists and is connected.

ping uses Internet Control Message Protocol (ICMP) packets. The PING Request is the packet from the origin computer, and the PING Reply is the packet response from the target.

## **PoE**

PoE is an acronym for Power Over Ethernet.

Power Over Ethernet is used to transmit electrical power, to remote devices over standard Ethernet cable. It could for example be used for powering IP telephones, wireless LAN access points and other equipment, where it would be difficult or expensive to connect the equipment to main power supply.

### **Policer**

A policer can limit the bandwidth of received frames. It is located in front of the ingress queue.

### **POP3**

POP3 is an acronym for Post Office Protocol version 3. It is a protocol for email clients to retrieve email messages from a mail server.

POP3 is designed to delete mail on the server as soon as the user has downloaded it. However, some implementations allow users or an administrator to specify that mail be saved for some period of time. POP can be thought of as a "store-and-forward" service.

An alternative protocol is Internet Message Access Protocol (IMAP). IMAP provides the user with more capabilities for retaining e-mail on the server and for organizing it in folders on the server. IMAP can be thought of as a remote file server.

POP and IMAP deal with the receiving of e-mail and are not to be confused with the Simple Mail Transfer Protocol (SMTP). You send e-mail with SMTP, and a mail handler receives it on your recipient's behalf. Then the mail is read using POP or IMAP. IMAP4 and POP3 are the two most prevalent Internet standard protocols for e-mail retrieval. Virtually all modern e-mail clients and servers support both.

### **PPPoE**

PPPoE is an acronym for Point-to-Point Protocol over Ethernet.

It is a network protocol for encapsulating Point-to-Point Protocol (PPP) frames inside Ethernet frames. It is used mainly with ADSL services where individual users connect to the ADSL transceiver (modem) over Ethernet and in plain Metro Ethernet networks (Wikipedia).

### **Private VLAN**

In a private VLAN, PVLANS provide layer 2 isolation between ports within the same broadcast domain. Isolated ports configured as part of PVLAN cannot communicate with each other. Member ports of a PVLAN can communicate with each other.

### **PTP**

PTP is an acronym for Precision Time Protocol, a network protocol for synchronizing the clocks of computer systems.

### **QCE**

QCE is an acronym for QoS Control Entry. It describes QoS class associated with a particular QCE ID.

There are six QCE frame types: Ethernet Type, VLAN, UDP/TCP Port, DSCP, TOS, and Tag Priority. Frames can be classified by one of 4 different QoS classes: "Low", "Normal", "Medium", and "High" for individual application.

## **QCL**

QCL is an acronym for QoS Control List. It is the list table of QCEs, containing QoS control entries that classify to a specific QoS class on specific traffic objects.

Each accessible traffic object contains an identifier to its QCL. The privileges determine specific traffic object to specific QoS class.

## **QL**

QL In SyncE this is the Quality Level of a given clock source. This is received on a port in a SSM indicating the quality of the clock received in the port.

## **QoS**

QoS is an acronym for Quality of Service. It is a method to guarantee a bandwidth relationship between individual applications or protocols.

A communications network transports a multitude of applications and data, including high-quality video and delay-sensitive data such as real-time voice. Networks must provide secure, predictable, measurable, and sometimes guaranteed services.

Achieving the required QoS becomes the secret to a successful end-to-end business solution. Therefore, QoS is the set of techniques to manage network resources.

## **QoS class**

Every incoming frame is classified to a QoS class, which is used throughout the device for providing queuing, scheduling and congestion control guarantees to the frame according to what was configured for that specific QoS class. There is a one to one mapping between QoS class, queue and priority. A QoS class of 0 (zero) has the lowest priority.

## **RARP**

RARP is an acronym for Reverse Address Resolution Protocol. It is a protocol that is used to obtain an IP address for a given hardware address, such as an Ethernet address. RARP is the complement of ARP.

## **RADIUS**

RADIUS is an acronym for Remote Authentication DialIn User Service. It is a networking protocol that provides centralized access, authorization and accounting management for people or computers to connect and use a network service.

## **RDI**

RDI is an acronym for Remote Defect Indication. It is a OAM functionality that is used by a MEP to indicate defect detected to the remote peer MEP

## **Router Port**

A router port is a port on the Ethernet switch that leads switch towards the Layer 3 multicast device.

## **RSTP**

In 1998, the IEEE with document 802.1w introduced an evolution of STP: the Rapid Spanning Tree Protocol, which provides for faster spanning tree convergence after a topology change. Standard IEEE 802.1D-2004 now incorporates RSTP and obsoletes STP, while at the same time being backwards-compatible with STP.

## **SAMBA**

Samba is a program running under UNIX-like operating systems that provides seamless integration between UNIX and Microsoft Windows machines. Samba acts as file and print servers for Microsoft Windows, IBM OS/2, and other SMB client machines. Samba uses the Server Message Block (SMB) protocol and Common Internet File System (CIFS), which is the underlying protocol used in Microsoft Windows networking.

Samba can be installed on a variety of operating system platforms, including Linux, most common Unix platforms, OpenVMS, and IBM OS/2.

Samba can also register itself with the master browser on the network so that it would appear in the listing of hosts in Microsoft Windows "Neighborhood Network".

## **SHA**

SHA is an acronym for Secure Hash Algorithm. It designed by the National Security Agency (NSA) and published by the NIST as a U.S. Federal Information Processing Standard. Hash algorithms compute a fixed-length digital representation (known as a message digest) of an input data sequence (the message) of any length.

## **Shaper**

A shaper can limit the bandwidth of transmitted frames. It is located after the ingress queues.

## **SMTP**

SMTP is an acronym for Simple Mail Transfer Protocol. It is a text-based protocol that uses the Transmission Control Protocol (TCP) and provides a mail service modeled on the FTP file transfer service. SMTP transfers mail messages between systems and notifications regarding incoming mail.

## **SNAP**

The SubNetwork Access Protocol (SNAP) is a mechanism for multiplexing, on networks using IEEE 802.2 LLC, more protocols than can be distinguished by the 8-bit 802.2 Service Access Point (SAP) fields. SNAP supports identifying protocols by Ethernet type field values; it also supports vendor-private protocol identifier.

## **SNMP**

SNMP is an acronym for Simple Network Management Protocol. It is part of the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol for network management. SNMP allow diverse network objects to participate in a network management architecture. It enables network management systems to learn network problems by receiving traps or change notices from network devices implementing SNMP.

## **SNTP**

SNTP is an acronym for Simple Network Time Protocol, a network protocol for synchronizing the clocks of computer systems. SNTP uses UDP (datagrams) as transport layer.

## **SPROUT**

Stack Protocol using ROUTing Technology. An advanced protocol for almost instantaneous discovery of topology changes within a stack as well as election of a master switch. SPROUT also calculates Parameters for setting up each switch to perform shortest path forwarding within the stack.

## **SSID**

Service Set Identifier is a name used to identify the particular 802.11 wireless LANs to which a user wants to attach. A client device will receive broadcast messages from all access points within range advertising their SSIDs, and can choose one to connect to based on pre-configuration, or by displaying a list of SSIDs in range and asking the user to select one (wikipedia).

## **SSH**

SSH is an acronym for Secure SHell. It is a network protocol that allows data to be exchanged using a secure channel between two networked devices. The encryption used by SSH provides confidentiality and integrity of data over an insecure network. The goal of SSH was to replace the earlier rlogin, TELNET and rsh protocols, which did not provide strong authentication or guarantee confidentiality (Wikipedia).

## **SSM**

SSM In SyncE this is an abbreviation for Synchronization Status Message and is containing a QL indication.

## **STP**

Spanning Tree Protocol is an OSI layer-2 protocol which ensures a loop free topology for any bridged LAN. The original STP protocol is now obsolete by RSTP.

## **Switch ID**

Switch IDs (1-16) are used to uniquely identify the switches within a stack. The Switch ID of each switch is shown on the display on the front of the switch and is used widely in the web pages as well as in the CLI commands.

## **SyncE**

SyncE Is an abbreviation for Synchronous Ethernet. This functionality is used to make a network 'clock frequency' synchronized. Not to be confused with real time clock synchronized (IEEE 1588).

## **sFlow**

sFlow is an acronym for sample Flow. This protocol is used to monitor the sampled traffic on the switch. The sFlow Agent configures the sampling rate at which the samples have to be collected. The sFlow collector is configured to send the sample data to the external traffic monitoring application.

## **TACACS+**

TACACS+ is an acronym for Terminal Access Controller AccessControl System Plus. It is a networking protocol which provides access control for routers, network access servers and other networked computing devices via one or more centralized servers. TACACS+ provides separate authentication, authorization and accounting services.

## **Tag Priority**

Tag Priority is a 3-bit field storing the priority level for the 802.1Q frame.

## **TCP**

TCP is an acronym for Transmission Control Protocol. It is a communications protocol that uses the Internet Protocol (IP) to exchange the messages between computers.

The TCP protocol guarantees reliable and in-order delivery of data from sender to receiver and distinguishes data for multiple connections by concurrent applications (for example, Web server and e-mail server) running on the same host.

The applications on networked hosts can use TCP to create connections to one another. It is known as a connection-oriented protocol, which means that a connection is established and maintained until such time as the message or messages to be exchanged by the application programs at each end have been exchanged. TCP is responsible for ensuring that a message is divided into the packets that IP manages and for reassembling the packets back into the complete message at the other end.

Common network applications that use TCP include the World Wide Web (WWW), e-mail, and File Transfer Protocol (FTP).

## **TELNET**

TELNET is an acronym for TELeType NETwork. It is a terminal emulation protocol that uses the Transmission Control Protocol (TCP) and provides a virtual connection between TELNET server and TELNET client.

TELNET enables the client to control the server and communicate with other servers on the network. To start a Telnet session, the client user must log in to a server by entering a valid username and password. Then, the client user can enter commands through the Telnet program just as if they were entering commands directly on the server console.

## **TFTP**

TFTP is an acronym for Trivial File Transfer Protocol. It is transfer protocol that uses the User Datagram Protocol (UDP) and provides file writing and reading, but it does not provide directory service and security features.

## **ToS**

ToS is an acronym for Type of Service. It is implemented as the IPv4 ToS priority control. It is fully decoded to determine the priority from the 6-bit ToS field in the IP header. The most significant 6 bits of the ToS field are fully decoded into 64 possibilities, and the singular code that results is compared against the corresponding bit in the IPv4 ToS priority control bit (0~63).

## **TLV**

TLV is an acronym for Type Length Value. A LLDP frame can contain multiple pieces of information. Each of these pieces of information is known as TLV.

## **TKIP**

TKIP is an acronym for Temporal Key Integrity Protocol. It used in WPA to replace WEP with a new encryption algorithm. TKIP comprises the same encryption engine and RC4 algorithm defined for WEP. The key used for encryption in TKIP is 128 bits and changes the key used for each packet.

## **U**

### **UDP**

UDP is an acronym for User Datagram Protocol. It is a communications protocol that uses the Internet Protocol (IP) to exchange the messages between computers.

UDP is an alternative to the Transmission Control Protocol (TCP) that uses the Internet Protocol (IP). Unlike TCP, UDP does not provide the service of dividing a message into packet datagrams, and UDP does not provide reassembling and sequencing of the packets. This means that the application program that uses UDP must be able to make sure that the entire message has arrived and is in the right order. Network applications that want to save processing time because they have very small data units to exchange may prefer UDP to TCP.

UDP provides two services not provided by the IP layer. It provides port numbers to help distinguish different user requests and, optionally, a checksum capability to verify that the data arrived intact.

Common network applications that use UDP include the Domain Name System (DNS), streaming media applications such as IPTV, Voice over IP (VoIP), and Trivial File Transfer Protocol (TFTP).

### **UPnP**

UPnP is an acronym for Universal Plug and Play. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components

### **User Priority**

User Priority is a 3-bit field storing the priority level for the 802.1Q frame. It is also known as PCP.

### **VLAN**

Virtual LAN. A method to restrict communication between switch ports. VLANs can be used for the following applications:

**VLAN unaware switching:** This is the default configuration. All ports are VLAN unaware with Port VLAN ID 1 and members of VLAN 1. This means that MAC addresses are learned in VLAN 1, and the switch does not remove or insert VLAN tags.

**VLAN aware switching:** This is based on the IEEE 802.1Q standard. All ports are VLAN aware. Ports connected to VLAN aware switches are members of multiple VLANs and transmit tagged frames. Other ports are members of one VLAN, set up with this Port VLAN ID, and transmit untagged frames.

**Provider switching:** This is also known as Q-in-Q switching. Ports connected to subscribers are VLAN unaware, members of one VLAN, and set up with this unique Port VLAN ID. Ports connected to the service provider are VLAN aware, members of multiple VLANs, and set up to tag all frames. Untagged frames received on a subscriber port are forwarded to the provider port with a single VLAN tag. Tagged frames received on a subscriber port are forwarded to the provider port with a double VLAN tag.

### **VLAN ID**

VLAN ID is a 12-bit field specifying the VLAN to which the frame belongs.

### **Voice VLAN**

Voice VLAN is VLAN configured specially for voice traffic. By adding the ports with voice devices attached to voice VLAN, we can perform QoS-related configuration for voice data, ensuring the transmission priority of voice traffic and voice quality.

### **WEP**

WEP is an acronym for Wired Equivalent Privacy. WEP is a deprecated algorithm to secure IEEE 802.11 wireless networks. Wireless networks broadcast messages using radio, so are more susceptible to eavesdropping than wired networks. When introduced in 1999, WEP was intended to provide confidentiality comparable to that of a traditional wired network (Wikipedia).

### **WiFi**

WiFi is an acronym for Wireless Fidelity. It is meant to be used generically when referring of any type of 802.11 network, whether 802.11b, 802.11a, dual-band, etc. The term is promulgated by the Wi-Fi Alliance.

### **WPA**

WPA is an acronym for Wi-Fi Protected Access. It was created in response to several serious weaknesses researchers had found in the previous system, Wired Equivalent Privacy (WEP). WPA implements the majority of the IEEE 802.11i standard and was intended as an intermediate measure to take the place of WEP while 802.11i was prepared. WPA is specifically designed to also work with pre-WPA wireless network interface cards (through firmware upgrades), but not necessarily with first generation wireless access points. WPA2 implements the full standard but will not work with some older network cards (Wikipedia).

### **WPA-PSK**

WPA-PSK is an acronym for Wi-Fi Protected Access - Pre Shared Key. WPA was designed to enhance the security of wireless networks. There are two flavors of WPA: enterprise and personal. Enterprise is meant for use with an IEEE 802.1X authentication server, which distributes different keys to each user. Personal WPA utilizes less scalable 'pre-shared key' (PSK) mode, where every allowed computer is given the same passphrase. In PSK mode, security depends on the strength and secrecy of the passphrase. The design of WPA is based on a Draft 3 of the IEEE 802.11i standard (Wikipedia).

### **WPA-Radius**

WPA-Radius is an acronym for Wi-Fi Protected Access - Radius (802.1X authentication server). WPA was designed to enhance the security of wireless networks. There are two flavors of WPA: enterprise and personal. Enterprise is meant for use with an IEEE 802.1X authentication server, which

distributes different keys to each user. Personal WPA utilizes less scalable 'pre-shared key' (PSK) mode, where every allowed computer is given the same passphrase. In PSK mode, security depends on the strength and secrecy of the passphrase. The design of WPA is based on a Draft 3 of the IEEE 802.11i standard (Wikipedia).

### **WPS**

WPS is an acronym for Wi-Fi Protected Setup. It is a standard for easy and secure establishment of a wireless home network. The goal of the WPS protocol is to simplify the process of connecting any home device to the wireless network (Wikipedia).

### **WRED**

WRED is an acronym for Weighted Random Early Detection. It is an active queue management mechanism that provides preferential treatment of higher priority frames when traffic builds up within a queue. A frame's DP level is used as input to WRED. A higher DP level assigned to a frame results in a higher probability that the frame is dropped during times of congestion.

### **WTR**

WTR is an acronym for Wait To Restore. This is the time a failure on a resource must be 'not active' before restoration back to this (previously failing) resource is done.
